Change of Line.

WHAT SMALL FARMS WILL DO.

The diffusive farmer spreads his manure and labor over a large territory, producing unsatisfactory results. He is more intent on acres than bushels, and seeks to increase the area rather than the vield. Most American farmers have little idea of the capabilities of an acre of land, but the experiments conducted at the "Riverside Stock and Experimental Farm." Avon Springs, of giving you a little more spe-N. Y., an account of which is given in the Empire State Agriculturist, shows news to you promptly, that it will be acceptable. You can how management cau overcome difficulties. The farm contains thirty acres, and is mostly a reclaimed swamp, a portion of it," however, being stiff clay. Last year 7,000 heads of celery, between the rows of half an acre of sweet corn, were produced. The celery plants were set in a furrow between the rows after corn cultivation was finished, the corn serving to partially shade the celery. From one and three-quarter acres 2100 bushels of carrots were grown, 800 bushels of which were sold at 40 cents per bushel. Seven acres in corn produced 1700 bushels [ears] and from the same ground 161 bushels of medium beans

The materials are nainsooks, linonsd'Inde, mullsand Swisses. Some are very plainly made with little or no trimming beyond some deft handling of the material itself; and some are elaborate enough. The extreme prices are \$3.50 and \$60. An excellent plain dress is sold for \$5; neat and well made.

many more are within.

write or come.

Low prices can almost always be put upon such goods a little late in the season. It's rather early now; but profitable making appears to be over already.

Just now you have the double advantage of many such dresses to choose from and low prices. 1901 and 1308 Chestnut street.

> Ready-made dresses of a black-and-white striped fabric that looks like summer silk, but is silk-and-cotton. For general wear they will be found quite good enough; better indeed than summer-silk. Well made and substantial; but the chief virtue is in the price, \$10.

1801 and 1805 Chestnut street, second floos.

Black grenadines have been one of the most distinguished features of our trade for two months past. We have had the finest in the world, and all grades down to the poorest These instances demonstrate that by that we care to keep; and a wonderful variety of patterns.

Figured grenadines that Large farms are not so desirable as small ones thoroughly cultivated. The brought \$2 lately are selling at manure required for an acre is, to a con-\$1. And this may be taken as siderable extent, wasted when spread

Porous Plasters.

Reasons Why they are Preferred to All Other Porous Plasters or External Remedies:

First. Because they possess all the merit of the strengthening porces plaster, and contain in ad-dition thereto the newly discovered powerful and active vegetable combination which acts with in-creased ruberacient, stimulating, sedshive and sounter irritant effects.

Second. Because they are a genuine pharmaceutical prep-ration, and so recognized by the profession. **Third.**

Because they are the only plasters that relieve Fourth.

Because they will positively cure diseases which ther remedies will not even relieve. Fifth. Because over 7000 physicians and draggists have voluntarily testified that they are superior to all other plasters or medicines for external use,

Sixth. Because the manufacturers have received the only medals ever given for porous plasters.

THE ARMY WORM.

As a discription of the appearance and habits of this worm, as well as the methods of destroying it, will undoubtedly be interesting to many readers, we make a few extracts from a letter written by a correspondent in Tennessee to the Cultivator and Country Gentleman. He begins the letter by saving that the prospects for good corn and wheat crops are very fine, but that farmers are not content, saving :

"The army-worm has come and we will be ruined. The army-worm originates in old meadow lands more particularly, and where there are no meadows in the neighborhood I hear of no worms. They travel from the meadows to the wheat, oats, rye, barley and corn, If the wheat, rye and barley are past the bloom, and making the grain when attacked by the worm, the grain is often benefitted by being stripped of the blades than injured. Oats, if attacked are generally ruined-so is corn ; both being very tender plants, the worms go for them heavily. I will describe the worm for the benefit of those who are unacquainted with him : He is bald-headed, well formed, black body, with two rather yellow than white stripes from head to tail. When full grown it is a fourth less in size than a common pencil, and when ready to deposit his cotton is yellow and very clumsy and slow, but in almost constant motion and very hungry eating rapidly until he disappears .-Where he goes I do not know ; he simply goes out of sight. I find no holes that he goes into, nor do I find him dead on the ground. Where does he go? I walked the ditch two hours this evening and the foregoing is the only description can give you "He is, I might say, rather an innocent looking worm, and has not the hideous look of the cut and measuring worms. The workmen upon my farm

CORN STARCH CORSET JEANS. COMBS have been giving him battle for four or CRACKERS. five days. First between my wheat CREAM TARTER. field and meadows, and corn field and CURRANTS, meadows, we ditched, throwing the earth out on the meadow side, and making the side next to the wheat and corn slanting under, so that when the worms come into the ditch, which they do by the thousands and millions, they attempt to crawl out on the corn and wheat side. and fall back, and when collected in the ditch we hitch a mule or horse to a log of wood and draw it up and down the ditch and mash the enemy to death. With a little care they never pass the ditch. As I before stated, they never originate in a wheat or corn field, unless the wheat has been sown on an old meadow. But if they do get into the wheat there is only one mode of fighting them, and that is by the old Virginia mode, The worms crawl up the stalk and strip the blades off up to the head, if you will stand idly by and let them do so. To prevent this is almost too cheap and simple to relate. The worm is very clumsy and the least shock precipitates him to the ground, and while there he does little or no damage. "Take a rope from fifty to one hundred feet in length and weight in the middle, and put a man or boy at each end of it and let them pass the rope over the field once a day so long as the worm lives, which is usually ten days, and you will save the field from injury. The fat fellows are never to make a sec-
