THE CHERRY. The cherry comes originally from Asia. After a victorious expedition in-to Pontus, the Roman general, Lucullus, brought the cherry from Cerasus, a town of that province, into Italy. Sol-dier though he was, he had an eye open to whatever was agreeable in the way of food, and it is not to be doubted that he regarded the cherry as one of the proudest of all his trophies. The cherry was then brought to Rome about 70 years before Christ. About 120 years later it it was introduced into Great Britain.

From Italy it was brought also into all

the other countries of Europe, in every one of which it is now a universal favorite with all classes of the people. The Roman horticulturist soon produced other specimens of the cherry, and Pliny makes mention of eight different varieties which were extant in his day. It shows what great things can be accomplished by cultivation and art, and more than three hundred different varieties are now specially described in the official catalogues. The gum of the cherry is almost identical with gum arabic, and it has frequently been utilized for food. The wood of the cherry is very beau-

tiful and much used for furniture. Some people of good taste admire it as much as mahogany. It is hard, compact and tough, and it possesses the rare virtue of not warping. It takes on a high polish. Its beautiful reddish tint, instead of fading with time, grows deeper and deeper every year.

In Germany, the cherry tree is a great favorite, and is extensively used as an ornamental shade tree. Many road-sides are lined with cherryltrees on both sides. You will frequently pass through an avenue of these beautiful shade trees for miles at a time. Loudon makes record of the fact in his work called "Arboretum" that in the year 1828 he traveled for several days through a continuous avenue of cherry trees from Strasbourg by a circuitous route to the city of Munch. Whether they were in fruit, or in blossom, or merely in leaf, the ride must have been a charming one.

"These avenues in Germany," says Loudon, "are planted at the desire of the respective governments, not only for shading the traveler, but in order that the poor pedestrian may obtain refreshment during his journey. All persons are allowed to partake of the cherries on condition of not injuring the trees; but the main crop, when ripe, is gathered by the respective proprietors of the land on which they grow. The celebrated kirchenwasser of the Germans is made of the wild cherry of the Black Forest. Stones and all are fermented with the pulp. The ratifia cordial of Grennoble are made of the cherry. So is maraschi-no, which is the most celebrated of all Italian liquors. The leaves, the kernels, as well as the pulp of the fruit, are fermented together. A quantity of honey is also added. From the result of all this maraschino is the product of distil-

WHY A KEROSENE LAMP EPXLODES.

Girls, as well as boys, need to under-stand about kerosene explosions. A great many fatal accidents happen from pouring kerosene oil ou the fire to make it kindle better; also by pouring oil in a lamp while lighted. Most people suppose that it is the kerosene itself which explodes, and that if they are careful to keep the oil itself from the fire or light there will be no danger. But this is not so. If a can or lamp is left about half full of kerosene oil, the oil will dry up, or "evaporate," a little, and will form,

by mingling in the air in the upper part very explosive gas. You cannot see this gas any more than you can see the air. But if it is disturbed and driven out, and a blaze reaches it, a terrible ex-plosion ensues, although the blaze did not touch the oil. There are several other liquide used in houses and work other liquids used in houses and workshops which will produce an explosive vapor in this way. Benzine is one; burning fluid is another, and naphtha, alconol, ether, chloroform may do the same

In a New York workshop lately, there was a can of benzine, or gasoline, standing on the floor. A boy lighted a cigarette, and threw the burning match on floor, close to the can. He did not dream there was any danger, because the liquid was corked up in a can, but there was a terrible explosion, and he badly hurt. That seems very mysterious. The probability is that the can had been standing there a good while, a good deal of vapor had formed, some of which had leaked out around the stopper and was hanging in a sort of invisible cloud over and around the can : and this cloud, as

the match struck it, exploded. Suppose a girl tries to fill a kerosene lamp without blowing it out. Of course the lamp is empty or she would not care to fill it. This empty space is filled with a cloud of explosive vapor arising from the oil in the lamp. When she pushes the nozzle of the can into the lamp at the top, and begins to pour, the oil, runing into the lamp, fills the empty space and pushes the cloud of vapor up : the vapor is obliged to pour out over the top, into the room outside. Of course it strikes the blazing wick the girl holds at one side. The blaze of the wick sett the invisible cloud of vapor on fire, and there is an explosion which ignites the oil and scatters it over her and over the furniture of the room. This is the way in which kerosene lamps burst. The same thing may happen when the girl pours the oil over the fire in the range or the stove, if there is a cloud of explosive vapor in the upper part of the can, or if the stove is hot enough to vaporize quickly some of the oil as it falls. Remember it is not the oil, but the invisible vapor that explodes. Taking care of the oil will not protect you. There is no sufety but in this rule : Never pour oil on a lighted fire or in a lighted lamp. -- Christian Union.
