ARTIFICIAL INCUBATION.

There is not the slighest reasons to believe that when the ancient Egyptians invented a method of artificially hatching eggs they were influenced by any desire to lessen the labor of bens, Their sole object was to produce more chickens than the hens produced. Although we may give a setting hen credit for the best possible intention, it may be admitted that she is a very clumsy bird. She will tread on her eggs and leave more or less of them out in the cold. Besides, her capacity to hatch eggs is limited by her size. There are very few bens who can hatch out more than a dozen chickens, and, of course, if a man wishes to raise chickens on a large scale he must supply himself with an immense number of hens. Artificial incubation obviates all these difficulties. As invented by the Egyptians and extensively practiced in our own day, a thousand eggs can be hatched at one time in a single incubator, and not one of these runs any risk of being broken or chilled.

The immense success which has attended this process in France recently attracted the attention of Dr. Travenier, a learned and ingentous physician. He attended to a hospital for foundlings and although the position gave him an admirable opportunity for experimentght ainm or phosphate powders. Sold only in z. Royar Baurno Powden Co., 100 Wall St., w York. [9-25, 82,-1y.] ing with new medicines, he was a humane man, and he was annoyed at the arge number of foundlings that died within the first six months of their life. The majority of those admitted to the hospital were weak and sickly, but in that respect they did not suffer from the majority of French infants. Dr. Tavenier felt that it was a reproach to medical science that French infants could not be cultivated with as much success as French chickens, and he resolved to try what artificial incubation-if it may be called so-would accomplish if applied to infants.

The doctor constructed a child incubator on precisely the model of the chicken lincubator. It was a box covered with a glass side furnished with a soft woolen bed and kept at the temperature of 86° Fahrenheit by the aid of hot water. He selected as the subject of his first experiment a miserably made infant, one, in fact, that had rashly insisted on beginning the world at an injudiciously early period. This infant was placed in the incubator, provided with a nursing bottle, and kept in a dark room. To the surprise of the doctor the child ceased to cry on the second day after it was put in the incubator, and although it had been a preternaturally sleepless child, it sank into a deep, quiet sleep. The child remained in the incubator about eight weeks, during which time it never once cried, and never remained awake except while taing nourishment. It grew rapidly, and when, at the expiration of sixty days, it. was removed from the incubator it presented the appearance of a healthy infant of at least a year old.

Delighted with the success of this experiment. Dr. Tavenier selected an ordinary six-months old child, addicted to the usual pains and colle, and exhibiting the usual fretfulness of a French infant. This child conducted itself while in the incubator precisely as its prederessor had done. It never eried; spent its whole time in sleep, and it grew as Mattresses. &c., By Gen. Sherman. if it had made up its mind to embrace the career of a professional giant. After a six weeks stay in the incubator it brief period it had doubled its weight. It had become so strong and healthythat it resembled a child of three years old, and it could actually walk when holding on to a convenient piece of furniture These two experiments satisfied Dr. Tavenier of the vast advantages of artificial incubation. He immediately proceeded-with the permission of the authorities of the hospital-to construct an incopator of the capacity of four hundred infants who were in the hospi tal on the 10th of February last, With the exception of one who died of conenital hydrocephalus and another who as claimed by its repentant parents, he children were kept continually in he incubator for six months, when they were removed in consequence of having outgrown their narrow beds. The result will seem almost incredible to persons who are unfamilar with the reputathe report made to the French government on the subject by a select commitee of twelve. The average age of the nfants last February was three months and three days-the youngest being less than 12 hours old and the oldest being twelve months. Their average weight was sixteen pounds, only one of the entire 360 having attained a weight of 32 pounds. At the end of six months of artificial incubation the average weight of each infant was 84 pounds, and there was not one who would not have been

supposed by a casual observer to be at east eight years old. In other words six months of artificial neubation did as much in the way of developing Dr. Tavenier's foundlings as RIVINIUS' BLOCK, eight years of ordinary life would have done. The infants were strong and healthy, as well as big; they walked in a week after leaving the incubator, and some of them have since learned to talk. These results surpassed Dr. Tavenier's most enthusiastic expectations, and there can be no doubt that his system of artificial child incubation will be adopted not only by every child's hospital in France, but in every private family in the civilized world. — Times.

PAINTING WITH PETROLEUM.-The HAS always on hand a large, varied and ele-gant assortment of WATCHES, CLOUKS, JEWELRY, SPECTACLES, EYE-GLASSES, &c., which he offers for sale at lower prices than any other dealer in the county. Persons needing anything in his line will do well to give him a call before purchasing classwhere. following paragraph is quoted in an agricultural contemporary, and comment made as given in the succeeding par-

"Petroleum is found to be of benefit Watches, Jewelry, &c., and satisfaction guaranteed in both work and price. pardens, makes it more compact in texture, and also rather less liable to take ire, although when once burning they will of course make more flame than the wood without it; but a coat of petrolom applied to a shingle roof will make t last several years longer than it otherwise would. Petroleum is also an excellent article to apply to the iron and steel work of farm implements to prevent their rusting when not in use. When any outbuilding, or even your dwelling house, is to be painted, onehalf the expense may be saved by applying a coat of petroleum with a fine white wash brush, and afte letting it dry two or three weeks, put on one coat of paint ; by so doing a second coat of paint is rendered unnecessary, and that much oney saved."

We have given this a practical test and know that it is sound advice. Our dwelling was without repair for fifteen [0][0]S. years. The paint had fallen off in various places, and the siding was badly checked, so that it looked as though barrel of crude petroleum. The oil v billed to us at three cents per gallon \$1.20. The 40 gallon cask contains it cost us about \$2.00 and the frant cost us as much as the barrel and dogether. Yet the whole expense wgess than \$7. The house was given a of Averill paint. The petroler filled the checks and hardened the bod so WANTED SERGETIC, REMIRES MEN one coat of paint only was fessary.

Stored Fruit Trees, Grape Vines, Shrubs, Robes, and GOOD SALARIES and have passed and of paint has proved more durable that he first, being less inclined to scale of han that [9-28.-2m.*] J. F. LeCLARE, Rochester, N. Y. which was placed upon the ked pine.

CLIPPINGS FOR THE CURIOUS.

A German has invented a gunpowder that water won't hurt. To every 400-pound bale of cotton there are 1,200 pounds of seed Young salmon increase in weight from three to seven pounds in four weeks'

A drum manufactory in Massachusetts, established in 1853, has converted during that time 30,000 sheep skips into dram heads.

The word "daughter" common to all Indo-European languages, means milk-

er, and bears witness to the early training of the cow. The length of the submarine cables in the whole world is estimated to be 64,-000 miles and their value to be \$202,-000,000. The length of all the wires in the world would reach fortyeight times

around the earth. According to the report of the commissioner of agriculture for 1870, the larvæ of a large fly which frequents Mono lake, in California, are dried and pulverized and mixed with acorn meal and baked for bread, or with water and boiled for soup. Iceland was visited by a remarkable

sand storm last spring, which lasted for two weeks, and during which the temperature was intensely cold. The air was filled with dry, fine sand to such an extent that it was impossible to see more than a short distance, and the run was rarely visible. Glass-staining and glass-flower manu-

facture is a very extensive branch of the Austrian glass industry. It it now so developed that a petroleum flame gives some 1,540 yards of glass thread every minute, that are woven not only for glass cloths, etc., but also for watch chains, brushes, etc.

When the army of Suvaroy retreated from Elm in 1799 the march of the men loosened the snow of the Alps so that avalanches descended upon them and 300 mule drivers and their animals were buried under one of these immense snow slides. Only 17,000 of the 20,000 who left Elm made the march in safety. The balloon Reliance made a singular

flight from the Alexandra palace, London, recently. It rose gradually to a height of 1,500 feet, drifting in a northerly direction, then, when ballast had been thrown out, rose 1,500 feet more, At that a current carried it toward London, and through a thick mist it descended at the end of an hour upon the very place from which it had risen. The smallest circular saw in practical

use is a disk about the size of a five cent piece, being employed for cutting slits in gold pens. They are about as thick as ordinary paper and make 400 revolutions per minute, this high speed keeping them rigid, notwithstanding their extreme thinness. The northernmost place in the world where rye and oats mature is at Kengis,

in the Swedish province of Norbotten, forty-nine miles north of the polar circle, whereas the northernmost spot where corn is grown is at Muoniovara, ninety eight miles to north of the circle The rye yields, it is stated, ninety-eight per cent, and the cats about ninety. A dentist in Philadelphia has for some time successfully employed a simple

method of producing anesthesia before removing troublesome teeth. He requires the patient to practice during several minutes short and rapid respiration. The first effect is to make the head feel sensibility is benumbed and the teeth can be pulled with comparatively little pain, -Dr. Foote's Health Monthly, ABOUT EARLY RISING .- We have of-

ten wondered why farmers rise so early. There is no use of it. They inhale the miasma of the morning before the sun dissipates it; they get rheumatism from plouting about in the damp; they get dyspepsia by going out in the morning without a cup of coffee; they breathe ty phoid fever in the odors from the stables before the sun drives away the germ they lay a mortgage on health to lift a mortgage from the farm. Early rising as distinctive from lounging lazily is proper; but early rising just because it s early is fol-de-rol. Think of the average farmer's break

fast, by the glimmer of a lamp; the father, up before day, cross and ill-tempered because his stomach is full of gripes the boy just in from the cow pasture chatters his teeth by the stove; the girl in from milking has hardly had time to do up her back hair; the good wife is on the rush to get breakfast over so that she can get at the butter making-the only happy individual is the baby who sleeps the sleep of the just in its cradle. Even the old dog, with paw crossed over his nose, shows good sense by snoozing comfortably behind the stove, a kittle, beeping from one eye only after seeing that breakfast is all ready comes purring for a tid bit. Eerly to bed and early to rise is all right-but it were better to go out visiting in the evening, have plenty of parties and sociables and lots of fun even if it does incur a darling little nap in the morning. Anyhow as long as there are five times as many farmers in Dixmont as any other class of people it were well enough to consider whether or not this inflexible rule of "out of bed before daylight' were not more honored in the breach than in the observance.

THE FIRST SILK IN PENNSYLVANIA. John Schwartz, of York county, Pa, who is now 73 years of age, claims to have manufactured the first silk in the State. He has in possession several silk handkerchiefs and pieces of silk which he manufactured thirty-four years ago having raised the worms himself, fed them, reeled the silk and wove it on a common carpet loom. He had 80,000 worms in his possession, and not having room to take care of them he entered into a partnership with a Mr. Wagner, and the two erected a large two story cocoonery for the purpose of raising more worms and providing better accommodations for the large number already had, Mr. Wagner owning one and one-half millions. Mr. Schwartz wove over 200 vards of silk, which was 27 inches in width, and required 9,000 skits to the vard; that is the shuttle passes back and forth nine thousand times in every yard of silk woven. He also manufactured a web of silk with cotton chain, from which his wife and mother made under-

THE JEWSHARP MAKERS. - An Engshman has established a manufactory of jewsharps in Troy. It is said there are only two others in the country, one in New York and the other in Boston. A simpler instrument than the jewsharp it would be hard to conceive, but the manufacture comprises no less than twenty separate operations. The inventor of that humble instrument, which has been vibrating all over the world for centuries, is unknown to fame, At the beginning of the present century the ewsharp was developed by combining several instruments each with a separate pitch, and in 1827 Eulenstein, a native of Wurtemberg, made a sensation in London by playing on sixteen at once.

SAND FOR DYSPEPSIA, -A new and simple cure for dyspepsiawas brought to my attention by Hon, Pope Barrow, on Wednesday, He says: 'You know Web Barber, in Athens. Well, sir, he has cured himself of dyspepsia by eating white sand. Just common white sand picked up on the bed of a branch, He says that chickens eat sand to digest their food with, and he did not see why men could not do the same thing with profit. He ate a dose of sand and it cured him. Judge Henderson, the Commissoner of Agriculture, told me last night that he was eating sand for dyspepsia with good results. - Atlanta Con-
