MULCHING ORCHARDS.

Much discussion has been held in recent years in regard to the different methods of treating orchards. At the meeting of the Michigan Horticulcated a grass mulch. He cited orgrass mulch method for a number of space between the trees to grow up to | land is at all weedy. grass and clip it with scythe or mowground under the trees is covered diana Farmer. with some straw or any mulching material. This prevents the trees coming in direct contact with the grass. In a hilly section of southern Chio one grower found that he could afford to buy straw for \$8 per | good prices, most of it going to Engton, draw it over the hills eight miles land. and cover his entire orchard, as the ground was so poor he could not start | nal, shows the pains they take to engrass. The professor believes that it will pay any grower to buy \$5 and times. \$6 per ton straw for mulching the

If one is contemplating following this method he would do well to set the field while in sod, for if hilly the sod will prevent washing, the soil in grass constantly grows richer if none of the grass is drawn off and it adds humus and increases the water holding capacity of the soil. One would do better not to crop the field given over to the planting of the young orchard, as it takes from the soil plant food which will be needed later on by the trees themselves. Then the crops are of minor importance except for the first few years; after that the shade of the trees makes the crop so small that the trouble is scarcely worth while. Cultivation, too, burns up the humus.

The advantages of the grass mulch as enumerated by Professor Green are that it conserves moisture: shades the soil and thus makes it richer (this is due to the action of certain bacteria which cannot work in light); saves labor; easier to get orchard started; grow trees with lower heads because it is unnecessary to drive under them; this makes picking easier, prevents wind from having so good a chance to blow them down and saves apples from bruising so badly when they fall from the trees, as they do not fall so far. Trees seem to grow as well and better than in cultivated soils. Examples were given of young trees in orchards where the grass method was practiced, showing that the growth was as vigorous as it ought to be. In the five orchards of the Ohio station the grass mulch proved to influence a much better growth than the adjoining orchards receiving cultivation. Trees 16 years old, set 32 feet apart, had tops that would touch either side of a buggy driven between the rows. These orchards bear better than the cultivated ones, often earlier-Northern Spy trees bearing at seven years of age, and more regularly. In dry seasons the grass mulch conserves moisture better. The apples hang on the trees longer and when stored keep better.

## ONION CULTURE.

More attention is being paid to onion culture each year. The crop, if properly managed and under good conditions, is usually quite profitable. The soil should be moist and rich; fresh, clean land is preferred because of the less difficulty in keeping it clear of weeds, which are the chief drawbacks in growing this crop. Good preparation of the crop is essential. The ground should be deeply broken and thoroughly pulverized, hand work is more slow and laborious than with the horse, it is found onions in quantity to start with seed: sets are expensive. The seed should be sown as early as the ground can be put in good condition, and it has been found the most successful plan to sow first in seed beds. A bed 20 to 25 feet will start seed enough than is needed that does the mischief. for an acre, if drilled in rows only If just enough is given the calf the 4 or 5 inches apart. The seed should be covered only half an inch deep, clean. If a little is left too much and unless rain comes frequently the has been given. With the growing beds must be sprinkled twice a week. calf it is best to err on the side of When the onions are six inches high giving too little rather than of giving they may be transplanted to the field. in rows 12 inches apart, the plants 4 Inches apart in the rows. Clip off the roots and tips before setting; this makes the work of transplanting easier and does not check the growth. Experiments show that H pays well ence between a phrenologist and a to take this care in starting the young plants. Then they must be worked with scuffle hoe at once and constantly till out of the way of the weeds, and that may not be till they are ready for gathering. If weeds appear in the rows they must be spulled out by hand, even if you have to kneel to get at them. But this care. Gilfithers. ful, painstaking work pays with the onion for it often yields 400 bushels to the acre, and sells at an average

Four pounds of seed are enough for Cut No Ice With Her Until I Learned any acre if started in a seed bed as to Skate."-Judge.

described. If sets are wanted, instead of onions, 50 or 60 pounds of seed are required; some growers use 75 pounds, and the seed costs from 60c. to 75c. a pound. The sets sell at tural Society Professor Green advo- from\$3 to \$4 a bushel, and, as from 300 to 500 bushels can be grown upon chards of successful growers in Ohio an acre of good land, it is quite a and New York that had followed the profitable, though a laborious business. But do not undertake too much years and had found that it was more at first. One experienced grower satisfactory to them than the cultural says that one-quarter of an acre is method. The method is to allow the plenty to begin with, especially if the

> SECRET OF DANISH BUTTER MAKING.

> Denmark exports large quantities of butter which finds ready sale at

> The following from the Farm Joursure an equally good quality at all

> The Danes love their cows and give them every comfort; and the cows, not to be outdone in devotion, do their very best. All the stables I visited were fireproof, had concrete floors, and there was water so arranged that everything could be washed.

> Each stall had a tablet with the name of the cow, date of birth, pedigree, etc. There was also a slate on which a daily record was kept.

> If a cow is sick she is at once separated from the other animals and taken to the hospitas. It is a crime in Denmark to use or sell milk from a sick cow.

> The milking is done by women who are not allowed to wear sleeves below the elbow. They wear white linen caps and aprons, and must not only wash the bag of the cow, but also wash their own hands before milking, each time.

Everything fed the cow is prepared with great care-the quality and quantity is known as nearly as possible in the pastures every weed is pulled and the cow is not permitted to eat anything that will in any way taint the milk.

The cream is cerefully Pasteurized.

In short, the secret of Danish butter-making is perfect cleanliness and eternal vigilance, but the result is a product that will go through the tropics or the circumpolar region and come out standing up.

IMPORTANT WORK.

Mating is the most important work of the year, as the quality of next year's stock depends largely upon the judgment of the persons who mate up the pens. Not alone are the standard requirements to be considered, but also the health, vigor and productiveness of the fowls to be mated. A poor comb, bad plumage, discolored legs and other bad marks of a breeding bird is almost sure to be transmitted to the chicks.

DAIRY HINTS

The quality of milk a cow yields is born with her; the quantity, however, is influenced by the feed and care. No cow should be condemned as a poor and unprofitable one until she has been fed up to her full capacity as a milk yielder.

Adapt breed to purpose. There is but little money in milking "butter" cows and selling the milk in competition with a herd producing a large flow of common quality.

TO KILL POULTRY.

The best mode of killing poultry. as it causes instant death without pain or disfigurement, is to suspend the birds by trying their legs firmly but cultivation which should be fre to a pole at a convenient distance quent should be shallow. Although from the floor, and to open the beak and, with a sharp-pointed, narrowbladed knife, make an incision at the to be most profitable with onions. It back of the roof, which will divide is a very great saving, of growing the vertebra and cause immediate death.

FEEDING CALVES.

A safe rule in feeding calves is to give just what they will lick up clean -and no more. It is the little more bucket, or trough, will be licked too much.

At the Minstrels.

"What," asked Mr. Gilfithers, the eminent end-man; "what is the differman who runs in the dark?"

"I give it up," said Mr. Golsizzle, the other eminent end-man; for they were cutting the show short that evening in order to catch an early train to the next one-night stand. "One knows the bumps and the

other bumps the nose," explained Mr. Before the audience could reason it out Mr. Alphonse Rambolio, the cele-

brates counter-tenor, was half way through his touching ballad, "I Never

## Truths that Strike Home

Your grocer is honest and—if he cares to do so—can tell you that he knows very hittle about the bulk coffee he sells you. How can he know, where it originally came from,

how it was blended-or with what -or when roasted? If you buy your coffee loose by the pound, how can you expect purity and uniform quality?

LION COFFEE, the LEADER OF ALL PACKAGE COFFEES, is of necessity uniform in quality, strength and flavor. For OVER A QUARTER OF A CENTURY, LION COFFEE has been the standard coffee in millions of homes.

LION COFFEE is carefully packed at our factories, and until opened in your home, has no chance of being adulterated, or of coming in contact with dust, dirt, germs, or unclean hands.

In each package of LION COFFEE you get one full pound of Pure Coffee. Insist upon getting the genuine. (Lion head on every package.)

(Save the Lion-heads for valuable premiums.)
