MAGIC IN ZUNI TRIBE.

Priest Apparently Lifted a Jug of Water With a Feather.
"The most startling feat I ever saw," said a man who had made a study of Indians in various parts of the United States for his own edification, "was performed by the priests of the Zuni tribe in Arizona, or, as they were called, 'The Ancients of Creation.' They seat themselves in a circle on the clay floor around a jar that will hold perhaps a gallon, an ancient and sacred earthen vessel, which is filled with water. The chief priest carries in his hand two ordinary eagle feathers, which are tied together at the quill ends so that they make a fork. Behind the circle of the priests are other members of the tribe and the musicians with their drums and gongs, who join in the chants with emotion.
"The incantations continue for several hours, and when the participants and spectators are brought up to a proper pitch of excitement the priest dips the feather tips into the water, lifts the jar with them and holds it suspended for a minute or two at a height level with his face or breast. Then he lowers it slowly to the ground. This feat is repeated several times during the performance. Apparently there is nothing in the hands of the priest but the feathers, and they appear to be inserted into the mouth of the jar only two or three inches. Of course there is some trick about it, but I was never able to discover it."—Seattle Post-Intelligencer.

BONE STRUCTURE.

The Compact and the Spongy Kind and Their Strength.
Bone is of two kinds, compact and spongy. As the result of careful experiments it has been shown that compact bone is twice as strong as oak. Considered simply as building material. In the shaft of a long bone it is in reality much stronger than this, for it is arranged on the advantageous principle of the hollow pillar, which gives the fullest resisting power with the least possible expenditure of substance.
The delicate layers and bars of spongy bone are arranged on the principle of an arch, enabling very considerable pressures to be resisted. It was found that a cubic inch of this tissue taken from the lower end of the thigh bone and weighing only fifty-four grains was quite uninjured by a dead weight of 448 pounds.
The curved bones which roof in the skull are constructed to resist great pressure, while they check the transmission of shocks to the brain. Arranged in the form of a dome, they consist of compact bones, with a spongy layer between. These are known as "tables" of the skull. The outer and inner tables are immensely strong, while the middle table serves as a buffer by which the force of blows is distributed.
