WITH THE IMMORTALS.

Creators That Seem Never to Die From Old Age.

Wandering unconcernedly in the field of view of any high power microscope there may be seen an animal which has probably been living continuously ever since life first appeared on the earth and which has certainly never lost an ancestor by death. The creature is transparent and resembles a drop of slightly more viscid fluid in the thin film of water in which it is confined. Amoeba is the name by which it is known to science. Splash a drop of ink on paper, and you will have an idea of its form at any one moment, but it's form is never the same. Even as you watch it its shape, which had a resemblance to Ireland as it appears on the map, changes. The headlands at the southwest corner are becoming more and more prominent till now they are like the fingers of an outstretched hand of which the palm is rapidly shrinking. The whole creature is flowing rather than creeping toward a small chain of bacteria, which presently it devours. There is no mouth through which they pass. They are simply engulfed as small drops of water may be merged into a larger. In an hour or two they will have been digested—burned off as fuel to supply the activities of their destroyer.

Occasionally amid its ceaseless changes of form amoeba may be seen to be developing a "waist," which grows smaller and narrower until it snaps, and instead of one large animal we have two small ones, which, without even a momentary pause, continue the search for food till, in a few hours, each is full sized and ready to divide again.

But what has become of the original amoeba? In the absence of anything which could be called his corpse we cannot declare him dead. It must be said that he is still living as the two new amoebae. Now, this splitting into two being the only mode of reproduction of the race, it follows that all the previous parent amoebae from which our present two are descended are still living. Of course thousands of the animalculae are destroyed every day by natural foes, but it must be remembered that these unfortunates cannot by the nature of things leave any children and so will never be ancestors, and that so long as any one amoeba is living none of his direct ancestry is dead.

The conclusion has forced itself upon biologists that death is no part of the life scheme of these humble creatures. They are not like us—machines, preordained to run down in a more or less certain period of years—but they live on indefinitely till some chance accident cuts short their career. Youth, or, rather, immaturity, they experience from time to time, but old age never! Grand Magazine.

In the Hospital.

About two weeks ago Mrs. William C. Farnar and her daughter, Miss Mary, of near Colyer, went to Philadelphia, where the latter underwent an operation for a floating kidney. The operation was performed at the Jefferson hospital. The patient is getting along very well, and it is reasonably assured that the benefits will be permanent.

Ten or more years ago, Miss Farnar received a hard fall, and since that time she has been ill much of the time, and has tried many remedies prescribed by both local and other doctors.

The floating kidney was discovered by Dr. James K. Hosterman, who advised immediate attention. The first hospital surgeons disagreed with Dr. Hosterman's diagnosis of the case, but when taken to the Jefferson institution the examining surgeon ordered an operation for a floating kidney, the result of which is set forth above.
