

WHY DRUGGISTS RECOMMEND SWAMP-ROOT

For many years druggists have watched with much interest the remarkable record maintained by Dr. Kilmer's Swamp-Root, the great kidney, liver and bladder medicine.

It is a physician's prescription. Swamp-Root is a strengthening medicine. It helps the kidneys, liver and bladder do the work nature intended they should do.

Swamp-Root has stood the test of years. It is sold by all druggists on its merit and it should help you. No other kidney medicine has so many friends.

Be sure to get Swamp-Root and start treatment at once.

However, if you wish first to test this great preparation send ten cents to Dr. Kilmer & Co., Binghamton, N. Y., for a sample bottle. When writing be sure and mention this paper.—Advertisement.

Surely. The optimist says to remember that even if your mother-in-law has the gift of tongues it would be a lot worse if she were a mindreader.—Chicago American.

Three crops a year can be grown in the Panama canal zone.

Yes

it's toasted, of course. To seal in the flavor—

Sow Rye, Wheat and Oats

The South should sow more grain this fall to furnish food and feed. Let us supply you with the best tested varieties of smooth and bearded wheat.

Fulghum Oats

are the earliest oats suitable for fall sowing—very productive—are ready to harvest just before wheat crop can be followed with cow peas and soy beans. Virginia Gray Winter are the hardest oats, Gray Winter are the heaviest and are ready to cut just after wheat. If you want heavy yielding strains, tested for purity and germination, order

WOOD'S SEEDS

Abruzzi Rye

A splendid variety, especially on light soils—stools out well, gives a quick vigorous growth with large, well filled heads that mature early. Yields a good crop on land too poor for wheat—can be grazed during fall and winter without materially reducing the grain yield.

Write for information about our special grass and clover mixtures and get our new fall catalog and Crop Special giving latest prices.

EASY TO KILL

BABEK

The Quick and Sure Cure for MALARIA, CHILLS, FEVER and LA GRIPPE. It is a Powerful Tonic and Appetizer. Will cure that tired feeling, pains in back, limbs and head. Contains no quinine, arsenic or habit-forming ingredients.

CAFETERIA PLAN GAINS IN FAVOR

Plan for Feeding Stock Is Being Used on Many Farms in Corn Belt and Elsewhere.

'HOGGING DOWN' SAVES LABOR

Keeps Hogs in Good Condition, Distributes Manure Uniformly and Provides for a Simple Rotation of Crops.

Prepared by the United States Department of Agriculture.

Thirty or forty years ago some shrewd farmers fell into the habit of letting their hogs run in the cornfield in September and October and allowing them to eat ears and stalks until all that remained could be plowed under.

Some also turned hogs into the rye in the spring and let them range on the tender and succulent stalks until they became too woody to be palatable. This process was termed "hogging down."

Labor Shortage Changes Methods.

Then came a crusade for "clean farming"—typified by harvesting and shocking the corn stalks, husking the yellow ears and piling them into the cribs, later to be fed to the same hogs. "Hogging down" was decreed to be shiftless evasion of honest toil. The "hogging down" farmers fell into disfavor and dropped the practice to a large extent.

Meantime, the labor market was tightening, and a day's work came to be regarded not so much as something to be gotten out of the farmer or his sons or a hired man, but as a period to be paid for in money that could be used for other purposes.

The United States Department of Agriculture and some of the experiment stations in corn states have of late years given careful attention to the possibilities of feeding stock on the cafeteria plan. Today it is in use on hundreds of corn-belt farms and in many other localities in all parts of the country where corn is grown.

Hogging down corn saves labor, while causing no more waste than when the corn is harvested and hand fed. Properly managed, it keeps the hogs in better condition and adds weight more rapidly. It distributes manure uniformly. It leaves the ground in fair condition for the next crop, and it fits in with a rotation system admirably adapted to build up a run-down farm.

A Good Five-Year Rotation.

A system that is widely used calls for fencing the farm into five parts—six if you wish to retain a permanent pasture. Corn is planted in the first

Hogging Down Corn Saves Labor Without Undue Waste.

section and as soon as the kernels have become hard the hogs are turned in. As they have been on other feed, it will take a week or ten days' feeding to get them entirely on a corn diet. In the corn-belt latitude they may be expected to live entirely in the cornfield from about September 10 until the crop is consumed. It is generally found best not to permit the hogs range of the entire field, but to erect temporary fences. These can easily be built of 25-inch wire mesh, fastened to anchor posts at the ends and tied to corntalks instead of line posts. If a supplemental crop such as rape, cowpeas, soy beans, or even pumpkins, has been sowed among the corn, it will provide protein feed which the corn lacks.

The following spring the stalks and trash that remain on the surface of the field are cut over with a sharp disk and the ground prepared for a second crop of corn, which is harvested by hand, while the corn for "hogging down" is planted in the second tract.

The rye is used for hog pasture from early spring until the stalks become too hard. It will be found valuable pasture for brood sows with young pigs. After the pigs cease to consume the rye they are taken out and not returned until after the grain becomes ripe, when they are allowed to consume the entire crop and graze on the young clover until time to turn them into the corn in September.

The clover and timothy come on the next year and are used for hog pasture and the best parts kept for hay for other stock. The fifth year the timothy and clover crop is cut for hay and the sod turned under late in the fall to prepare the ground for the next year's "hogging down" crop, of corn.

SWEET CLOVER SEED MUST BE CERTIFIED

That of Biennial Cannot Be Told From Annual Product.

Smaller Growers Are Advised by Department of Agriculture to Secure Assurances Regarding Authenticity of Seed.

Prepared by the United States Department of Agriculture.

Last fall there were probably little more than 200 bushels of annual white sweet clover seed in existence, practically all grown in Iowa, Michigan or Alabama. Nearly all of this seed was used for increase purposes so that there is at present a considerable acreage growing. There are four or five large producers with acreages in Iowa, Michigan, Ohio, Texas and Alabama, but besides these there are hundreds of farmers with from one to several acres from which they expect to harvest a crop this year, part of which will be offered for sale.

The attention of these smaller growers is called to the fact that buyers will desire to be sure that the seed offered them next winter is that of the annual and not that of the biennial

A Cock of Sweet Clover Hay Which Has Been Cured to Excellent Condition.

white sweet clover. The seeds of the two cannot be distinguished, and it is quite possible that either by accident or design the cheaper seed of the biennial type may be sold for the more expensive annual plant. For this reason the United States Department of Agriculture urges prospective buyers to look carefully into the origin of every lot of seed offered. Growers of annual sweet clover this year should be able to state where they got their stock seed, when it was sowed, when it blossomed and when it was harvested. If any responsible state official can add his assurance that the field is true annual, such a statement would be worth getting.

The large growers are naturally preparing to meet all demands for evidence as to the purity of their stocks. Unless the smaller growers can also give adequate assurances regarding the authenticity of their seed it may be harder to sell and they may have to accept prices in line with those paid for common sweet clover seed. All such growers are advised to take up this matter with their farm bureaus, county agents or state experiment stations and protect themselves as far as possible.

STORAGE CELLAR ESSENTIALS

Should Be Located on Well-Drained Site and Insulated Against Cold and Heat.

The four things to be kept in mind in planning a storage cellar are: securing a well-drained site, on a knoll, if possible, but in any case where no water can settle back in the cellar; insulation against both cold and heat is necessary; the cellar should be supplied with plenty of moisture so that roots and tubers will not shrivel; at the same time it must be ventilated so that moisture does not condense or drip.

The following products can be stored in a root cellar so designed: Apples, asparagus, beans, bulbs, cabbage, canned fruit, carrots, celery, cranberries, fresh fruits, onions, parsnips, pears, potatoes, sauerkraut and tomatoes.

COVER CROPS IMPROVE SOILS

Not Grown as Much as They Deserve Nor as Frequently as Needed, in Many Instances.

Cover crops for fall and winter are not used as much as they deserve nor as frequently as the soil requires. More vegetable matter is greatly needed on thin soils. Those who break early and plant rye, wheat, oats, barley or clover will find advantages for improving soil and in extending the rotation to build up the land. Without humus it is a difficult matter to use commercial fertilizer to advantage. By turning the cover crop you make a beginning for better soil.

PROFITABLE AGE FOR FOWLS

Some Hens Are Not Good Producers After Their Second Year, Others Lay Longer.

The profitable age for hens varies with individuals. Some hens are not profitable after their second year, while others will pay their keep and more too for three or four years. In figuring up the value of a hen, consideration must be given the value of her eggs as well as to the number of them she will lay.

Some More Truths.

WOULD you use a steam shovel to move a pebble? Certainly not. Implements are built according to the work they have to do.

Would you use a grown-up's remedy for your baby's ills? Certainly not. Remedies are prepared according to the work THEY have to do.

All this is preliminary to reminding you that Fletcher's Castoria was sought out, found and is prepared solely as a remedy for Infants and Children. And let this be a warning against Substitutes, Counterfeits and the Just-as-good stuff that may be all right for you in all your strength, but dangerous for the little babe.

All the mother-love that lies within your heart cries out to you: Be true to Baby. And being true to Baby you will keep in the house remedies specially prepared for babies as you would a baby's food, hairbrush, toothbrush or sponge.

Exact Copy of Wrapper.

Children Cry For Fletcher's CASTORIA

Are You Prepared?

A doctor in the house all the time would be a good idea. Yet you can't afford to keep a doctor in the family to keep baby well or prevent sickness. But you can do almost the same thing by having at hand a bottle of Fletcher's Castoria, because it is a wonderful remedy for indigestion, colic, feverishness, fretfulness and all the other disorders that result from common ailments that babies have.

Fletcher's Castoria is perfectly safe to use. It is a harmless substitute for Castor Oil, Paregoric, Drops and Soothing Syrups. Children cry for Fletcher's Castoria, and mothers recommend it because they have found it a comfort to children and a mother's friend.

If you love your baby, you know how sweet it is to be able to help baby when trouble comes. You cannot always call upon a doctor. But doctors have nothing but good to say of Fletcher's Castoria, because they know that it can only do good—that it can't do any harm—and they wouldn't want you to use for baby a remedy that you would use for yourself.

MOTHERS SHOULD READ THE BOOKLET THAT IS AROUND EVERY BOTTLE OF FLETCHER'S CASTORIA
