SOY BEANS WILL STAND MOISTURE

One of the Best Forage Plants Among Legumes and Exceeds Others in Yield of Seed.

PREPARED SOIL IS ESSENTIAL

Application of Fertilizer on Fertile Land Usually Is Not Profitable-Crop Is Greatly Benefited By Lime.

The soy bean is one of the best forage plants among the legumes and it exceeds any of the others in yield of seed, says W. C. Etheridge of the Missouri College of Agriculture. It does not require a particular kind of soil. It will withstand a great deal of moisture and succumbs only when water stands on the land for a considerable time. On the other hand it is decidedly drouth-resistant.

For its best growth, the soy bean requires better preparation of the land than is necessary for cowpeas, because it cannot compete with weeds and grass so well as cowpeas.

Fertilizer Not Profitable . The application of fertilizer to the soy bean crop on either fertile or highly fertile land usually is not profitable.

Cultivating a Field of Soy Beans.

But on poor land good returns will nearly always follow a light application, 100 to 150 pounds per acre, of acid phosphate; or a light dressing, 5 commercial nitrogenous fertilizers to en-gathering bacteria on its roots.

our, poorly drained land much better | disease is made. than red clover and alfalfa, it is greatly benefited on such land by lime. In fact, under nearly all conditions a moderate application of lime will usually give good returns.

Inoculation Will Benefit. Although on fertile soils inoculation is not necessary for a thrifty growth, It will usually benefit the crop, and on

poor land it is essential for even moderate growth. For sections into which the crop is newly introduced, regardless of the type of soil, artificial inoculation will nearly always give good returns. Inoculating material, and instructions for its use may be secured at cost from the Missouri College of Agriculture, Columbia, Mo.

The best date for planting soy beans will of course vary with the locality, but it is a safe prortice to put in the crop about two weeks later than the average time of planting corn. The depth of planting is an important point. The seed must be planted shallow or poor stands will result. Experiments have proved that two inches is the most favorable depth.

For a crop planted in rows three feet apart-the best method where a seed crop is desired-15 to 20 pounds of seed will be required to the acre. A broadcasted or drilled crop-for hay -will require 60 to 90 pounds to the

FEEDING BEES SUGAR SIRUP

Extra Precaution Must Be Taken to Prevent Little Insects From Drowning.

When it is necessary to feed bees in winter, extra precaution must be taken to prevent them from drowning. Pour sugar sirup into a shallow dish or pan and cover with a cotton cloth large enough to drop over the edge of the dish. This allows the bees to crawl over the surface without being given a bath or drowning in the strup. Set the dish on the frames and see that the cloth is loose enough to settle to the bottom as bees use the slrup.

OVERCROWDING CAUSES ROUP

Dipping Affected Fowl's Head Into Common Cattle Dip Is Most Successful Cure.

Prevent roup by not overcrowding birds. In treating individual cases, best success has been obtained by taking a gallon sirup can, into which put a tablespoonful of the common cattle dips. Dip the affected bird's head. with mouth open, into this solution. Be sure to hold the bird's head downward while so doing. This treatment thoroughly disinfects the head parts, both inside and out. A second treatment may be necessary.

FARMERS BUY LARGE PART OF FOODSTUFF

Survey Shows That 30 Per Cent Is Brought in by Railroads.

More Prosperous Sections Seem to Purchase More Than Those Isolated - Smallest Volume of Home Production Is in East.

(Prepared by the United States Department of Agriculture.) Farmers should grow more of the food they consume and buy less of bors." food produced outside their immediate locality is the consensus of opinion of 25,000 farmers in all parts of the country recently questioned on the subject by the United States Department of Agriculture. The survey showed that of the food consumed by farmers and their families 70 per cent is produced locally, and nearly 30 per cent is brought in by railroad. In the judgment of the farmers 79 per cent of the food they consume could be economically produced locally.

In a general way the survey indicated that the more isolated farmers produce more of their foodstuffs than the less isolated, and that the more prosperous sections seem to buy more than the less prosperous. The thought back of the survey was that inasmuch as high freight rates have had a tendency to reduce the prices of products which farmers sell, and to increase the prices of the things they buy, they might economically produce more of their home requirements and thus become less dependent upon the railroads and the outside world.

By sections of the country the East South Central states, including Kentucky, Tennessee, Alabama and Mississippi, led in the volume of production for home consumption with 75.2 per cent. The smallest volume of home production is in the New England States, including Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut with 58.1 per

FIELD INSPECTION SERVICE

One-Reel Film Released by Department of Agriculture Pictures Different Operations.

Prepared by the United States Department of Agriculture.)

"Guarding live stock health," a new one-reel film recently released by the United States Department of Agriculture, shows the operations of the field inspection service of the bureau of animal industry. Attention is called to the large number of animals entering or 6 loads per acre, of stable manure. | the big stockyards each day, and the There is seldom any profit in applying fact that many of these animals are returned to farms as stockers and soy beans, for this crop gets nitrogen | feeders. Should some of the animals from the air through the aid of nitro- be diseased they would serve to spread infection through the country. There-Although the soy bean will grow on fore a thorough search for traces of

MUTTON SUPPLY FOR MARKET

Production Expected to Be Many Thousands of Pounds Over Figures Given for 1922.

Sheep feeding is booming and will result in the production of many thousands more pounds of mutton chops this year. Almost a third more sheep were in feed lots on January 1 than were there at the same date in 1922, according to government estimates. The largest increase in operations was in the irrigated region of the West; though the corn belt shows a gain of 14 per cent over 1922 feeding. Relief in financial conditions among farmers is considered largely responsible for this increase, which will put the country back on a 1921 basis in mutton production.

SCABIES CAUSING MUCH LOSS

Federal Inspectors Pass on Health of Nearly 25,000,000 Head of Sheep in 1922.

Last year inspectors from, the bureau of animal industry passed on the health of nearly 25,000,000 head of sheep with special reference to the presence of scables, a parasitic disease that causes a great deal of loss to ranchers if it is allowed to gain headway in flocks. More than 8,800,-000 of these sheep were dipped to destroy the parasites. The disease is quite prevalent in a number of the western range states, but the work of livestock health officials is resulting in improvement.

CONDOLENCES NOT IN ORDER

Strong Probability That Mrs. Green Would Not Have Welcomed That Suggested Committee.

"It's too bad about the Greens'," said the lady of the house. "We all feel so sorry for them. Such misfor-

"They had to give up their car and let the maid go. The janitor expects to put a 'for rent' sign in their window any day. Oh, dear!"

"You are fairly oozing sympathy," said the man of the house, attacking the grapefruit. "How nice it is to have such a bunch of thoughtful neigh-

"You don't understand," said the lady of the house. "Men never do. We all intend to call on Mrs. Green tomorrow and express our sympathy.' "I saw Green this morning," said

look particularly blue." "He's simply keeping up appear-

"How do you know he is ruined?" "Listen. It's this way. Monday they gave the maid two weeks' notice. Then the garage man said that their car was for sale, and the iceman told me the janitor told him he expected to put up the 'for rent' sign in Green's window.

"Go on," said the man of the house. "I suppose there'll be a patch in Green's coat tomorrow and he will abandon the use of a collar. Green will be running around needing a shave, like the hero when he loses his

"Today," continued the lady of the house, "an express wagon called and took away the piano and the talking machine."

"I think I can solve the mystery." chuckled the man of the house, "Green told me he and his wife were going to Europe on a long trip. He's been making money instead of losing it. He didn't care to pay the rent of an expensive apartment while he was away, and that's why he's been disposing of his household goods. A maid also is not necessary on a tour."

The man of the house paused in the doorway. "I would suggest calling off that condolence committee. Mrs. Green might not understand."

The lady of the house went to the telephone. She was still in a dazed condition as she called up Mrs. Por-

"Listen, my dear," she said, "I've the most surprising thing to tell you!" -Chicago News.

Machine Quickly Cleans Cotton.

A machine that embodies a novel process of opening and cleaning cotton by subjecting it to extremely rapid vibration in a current of air has been devoleped in England. The machine consists of a cast-iron base that supports a dust-proof sheetmetal casing with a semi-circular top, Inside which a horizontal, perforated drum rests for its whole length upon a small rotating brush, which slowly revolves the drum, keeping its perforations clean. Inside and at the bottom of the drum there is a small and rap idly revolving rotor with a large number of right and left-hand spiraled blades, so that when the cotton fed: into the machine falls on this rotor, it is kept in constant motion backward and forward and is thus thoroughly opened up, all dust adhering to it being removed. It then becomes so light that a current of air pumped through a plpe that penetrates one end of the drum blows the cotton through an outlet, at the other end, into a condenser, -Popular Mechanics Masszine.

Elephants Once Roamed Britain. Through what appears to have been a mere chance part of a tusk and some teeth of one of the largest species of British elephants were recently saved from an untimely end. Some laborers digging gravel for the paths of a new kitchen garden in the Deer park of Magdalen college, Oxford, came across the relics, that is to say, lying in untouched terracegravel about four to six feet below the surface of the soil. A casual onlooker ventured to doubt whether the first tusk found was ivory. In reply the digger said: "I will show you that it is ivory," and he immediately proceeded to prove his point by driving his pick into the tusk, breaking it up to make more gravel. Fortunately, attention was drawn to the site before the whole of the other tusk shared the same fate, four molar teeth being found close by. The part of the tusk that was rescued now constitutes a memorial to one of the earliest recorded inhabitants of the college site and is on exhibition in the college library.

New Medication for Toothache. According to the American Journal of Pharmacy, a bad toothache may be relieved quickly by means of a mixture of equal parts of benzyl alcohol and chloroform. A few drops of the mixture are placed on a piece of absorbent cotton and the saturated material is inserted into the tooth cavity. The action of the medicament is almost instantaneous, and lasts for quite a long time, which is not the case with any other medicament with the exception of cocaine. Denzyl alcohol has been known for a good many years as a very effective local anesthetic.

Statio Interference.

"Static," what it is and why it is, are known to ali radio experts, but how to eliminate it is absolutely unknown. Midday in summer is the time of minimum radio efficiency, when static is at its worst. Midnight in midwinter is the time of maximum radio efficiency, when static is practically un-
