House Has Bill Making Sunday Sports Optional With Counties-Other Legislative News.

Harrisburg, Pa .-- Governor Pinchot has served notice on the Vare-Grundy alliance that if they attempt to hamper departmental work by carrying out a threat to curtail appropriations listed in the budget, he will call back the legislature in special session. His ultimatumu was delivered to George S. Oliver, Pittsburgh pullisher, and a leading figure among a group of bosses supporting the political ambitions of Congressman Vare and Joseph R. Grundy, president of the Pennsylvania Manufacturers' Association.

Pinchot read the riot act to Oliver after he had been advised the ways and means committee, controlled by Grundy, had tentatively agreed to accept \$126,000,000 as the probable income figures for the next two years. and fungi, are thought to have it, but This sum is \$2,000,000 in excess of the estimate of Auditor General Lewis and \$6,850,000 less than the estimate of the administration budget compiled by Dr. Clyde L. King and a Philadelphia accounting firm.

The governor, it was said, worked himself into a protesting frame of mind when he learned that it is plan of the machine leaders to make inroads in the allotments to the budget to administrative departments. Summoning Oliver he made his threat of an extra session and advised him to carry the news to Grundy.

Fight Gains Impetus,

Added emphasis to the governor's fight against the alliance came in the house when Representative Stark introduced two measures designed to attract the attention of Mr. Grundy. One of them called for an amendment to the corporation tax law placing a five mill levy on the capital stock of manufacturing corporations. The other was a resolution for a constitutional amendment that would permit levying of an income tax.

Revenue of the proposed law would go into the general fund, another poses, another for state aid hospitals and the last into the highway department for allotment to township roads. The income tax resolution through an amendment to the constitution specthes that the legislature "shall have power to levy rates of taxation on earned and unearned income or direct or collateral inheritance and any graduated and progressive taxes on and grant exemptions from taxes on incomes and inheritances and profits derived from business. A movement looking to the construction of another bridge or a tunnel between Philadelphia and New Jersey made its appearance in the house in the shape of a bill offered by Representative Samuel Perry. The measure would authorize the governor to appoint a commission of seven members to co-operate with a similar commission from New Jersey "in planning and constructing such bridges or tunnels between Philadelphia and New Jersey as may be suitable or necessary."

Nemas Use Much Free Nitrogen

Insect Conditions All Over Country

Nitrogenous Fertilizers Are Most Costly Food Farm-

THE CENTRE REPORTER, CENTRE HALL, PA.

ers Must Buy.

(Prepared by the United States Department of Agriculture.) Although four-fifths of the atmos-

phere is nitrogen, the most expensive of our staple foods are those containing it and nitrogenous fertilizers are the most costly food the farmer must buy to feed his crops. This apparently paradoxical situation is explained by the fact that this prime necessity of plant and animal life is one of the most inert and insoluble of gases and consequently not easily put into combined form for use. The natural means for accomplishing its combination, so-far as known, are few, and the discovery of a new one is therefore of no small importance to science and to people in general.

Take in Nitrogen.

Dr. N. A. Cobb of the bureau of plant industry, United States Department of Agriculture, has observed that certain nemas-those threadlike organisms found widely distributed throughout the world in soil, water, and in plants, animals, and insectsseem to have the capacity to take in raw nitrogen, along with other constituents of the air, and combine it with other materials for their own use. The nitrogen-fixing bacteria of the soil have long been known to have this power and some of the very low forms of plant life, such as certain algae the nemas observed by Doctor Cobb are the highest form of life now known to make this direct use of atmospheric nitrogen. He observed that when these nemas were put in a culture solution they would swarm to the surface and swallow bubbles of air, keeping up this gulping for hours at a time. Watched under a microscope, these bubbles are seen to go down the oesophagus and then to disappear almost immediately after entering the intestines. In a short time these small organisms would consume several times their own volume of air which is four-fifths nitrogen and only one-fifth oxygen and other less common gases. Because of the known relative insolubility of nitrogen, the pldin conclusion is that these nemas combine it and make use of it in their Internal economy. Another fact that makes this conclusion seem correct is that they do this "air feeding" much more in a culture that is practically free of nitrogen.

Discover Organisms.

The possibilities for new knowledge regarding plant and animal nutrition and the keeping up of soil fertility be split four ways. One quarter would | are incalculable in view of this discovery and others which may be made would be set aside for school pur- in the same direction, thinks Doctor Cobb. Already several thousand soil organisms are known, but the activities of only a very few are understood Because of the rate at which new organisms are being discovered in this field, it is reasonable to believe that there are many thousands yet to be discovered and studied. When they are found and the scientists have learned what they do, it is reasonable to believe that many of our present methods of handling the soil and crops and, perhaps, animals, may undergo profound changes.

Field Workers Are Kept Informed by Monthly Survey.

(Prepared by the United States Department of Agriculture.) One means by which the bureau of entomology of the United States Department of Agriculture keeps its many field workers informed as to insect pest conditions all over the country is by issuing a monthly survey based on detalled reports from the several States and from the Dominion of Canada which has a similar service. The cooperation of the entomologists in the various states in supplying data on the general and unusual insect conditions in each region is now so well organized that the survey is in a position to report at any time on the entomological situation prevailing in any part of the United States and Canada. This cooperative agreement with Canada is especially useful in the case of pests

which may be just over the border, against which preventive steps may be taken.

In recognition of the survey's position it has been requested to participate in the meetings of the crop estimate board, to serve that board in an advisory capacity on the status of insect pests affecting the crops upon which this board issues estimates.

The survey has been in existence nearly four years. One of its functions has been the preparation of an index of common names upplied to insects in this country.

Peat Fertilizing Value Is Not Yet Understood

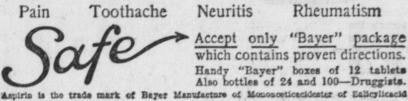

Every little while a question arises as to the fertilizing value of peat. This is a natural question, because the many peat deposits throughout northern sections of the country show a high content of nitrogen. Often it is claimed that this nitrogen in peat is comparable with nitrogen in commercial fertilizer. Peat has often been used as a filler

for low-grade fertilizers, and as a means of making a high analysis of nitrogen which is not really justified. The nitrogen content of peat has a very low availability, and any one who expects the value of this nitrogen to compare with the value of nitrogen in commercial fertilizers, is certain to be disappointed.

Peat lands may often be utilized to very good advantage by applying potash, which balances up the fertility sufficiently to produce a crop. Some very striking results have been achieved in northern Illinois by this treatment.

Asks Sunday Sports Vote.

Sunday base ball, football and other outdoor sports with Sunday motion pictures, musical concerts and dramatic performances would be made a question of local option under a bill introduced by Representative William H. Voltz, of Philadelphia. The measure would make mandatory the holding of a referendum in every county of the state, at the municipal elections this year, at which the citizens would be given an opportunity to declare for or against the "blue laws," under which Sunday sports are prohibited. It is provided that no sports shall be engaged in before 2 p. m. and no movie or other amusement conducted before 7 p. m. All base ball, football or other sports must be conducted at least 500 feet from a church. Mr. Voltz also is the sponsor of the "Anti-Tipping" bill. A bill providing for licensing of ho-

tels or restaurants in the state and fixing fees was introduced in the house by Representantive Coss, Allegheny. The secretary of health would be empowered to name a board of five inspectors and a salary of \$4000 for the chief and \$3000 for the others. No hotel or restaurant could be conducted after anuaury 1, 1926, without license, the bill provides.

A measure introduced by Representative Sowers extends the authority of the Department of Wharves, Docks and Ferries. No one is permitted to build or extend any wharf or bridge wholly within the city limits without getting a permit from the department.

In the senate Mrs. Flora M. Vare introduced a bill which would appropriate \$1,000,000 for the improvement of the Delaware river port facilities. Senator Daix introd. ced the bill which would transform the department of purchasing agent in Philidelphia into the department of supplies and give its head the title of director.

The nitrogen-consuming nemas stimulate interesting speculations.

Sweet Clover Useful in

Soil Building Program Profitable, permanent farming demands the use of some legume crop. Farmers are paying increasing attention to the importance of building ap the soil, where in the past it has in many sections been seriously depleted 'hrough improper methods.

Sweet clover, once considered as aothing but a weed, is fitting into the new soil-building program to a nicety.

It is a deep-rooted, vigorous growing egume. As a combined soll-building pasture and hay crop it has no equal and should find an important place on

Size of Calf at Birth

many farms.

The size of the calf at birth depends argely upon the size of the dam and sire. Jersey and Guernsey calves will weigh from 50 to 60 pounds at birth, Helstein calves, from 85 to 95 pounds. This fact must be taken into consideration in feeding. A small calf cannot consume as much milk as a large calf, and overfeeding a calf on milk is just as bad a practice as underfeeding. The former leads to trouble from securs: the latter, of course, prevents the calf from making normal gains.

Good Work in Orchard

Plant the orchard in good soll on a high piece of ground. Avoid slopes too steep to get over easily with a spraying outfit. Plant clean, healthy trees, You would not buy a diseased breeding animal, why buy a diseased fruit tree? Choose a few varieties adapted to your neighborhood, then cultivate crops between the trees, until they are of bearing age.

Liver Troubles of Fowls

Liver troubles in fowls cannot be treated as they are discovered too late but they can usually be prevented by the slogan used by horticultural workkeeping the birds exercising in deep litter for their scratch feed, and also feeding plenty of green feed to balance the ration. Poultry are, of course, subject to a certain death rate the an opportunity to apply phosphate same as other animals, and losses oc- where this was not applied with the casionally occur even when the hens wheat at seeding, and will do much to have the best of management.

been slightly frostbitten may be treated so that they will recover in a short time. Place the birds in a fairly cool room and treat them individually with a mixture made as follows: Heat five tablespoonfuls of grease until it becomes liquefied. Then stir in two tablespoonfuls of glycerin and a tablespoonful of turpentine. Apply once or twice a day. If the injury has been severe it will be best to cut off the entire comb, being careful to sear the cut part with a hot iron to prevent great loss of blood.

Cow for Producing Milk

Pure bred animals possess 100 per cent of the blood of their respective breed. Grade animals have a predominance of the blood of a given breed but less than 100 per cent, and they are usually by pure bred sires and out of native or grade cows. The better a cow is bred the greater insurance you have against disappointment when you buy or keep a cow for milk production. Purity of breeding, furthermore, tends to insure excellence of type.
