HOW CONCENTRATED FERTILIZERS SAVE FARMERS MONEY Shipping Plant Food Instead Of Filler Saves Big Freight And Handling Costs. The possibility of average savings in the delivered cost of commercial fertilizer amounting to \$16.03 per ton—or about 43 per cent, of the 1924 price—by the use of concentrated fertilizers from Muscle Shoals, was indicated in the December, 1925, report of President Coolidge's Muscle Shoals Inquiry. To date no one is known to have disputed this statement. Price relationships have, of course, changed somewhat since that time. While part of this possible saving is attributed to cheaper production costs at Muscle Shoals, part to the proposed limitation of profits, and part to cooperative purchasing by farm groups, a very important share is credited to savings in freight, bagging and handling charges due to the concentrated nature of the product. Less than 600 pounds of this highly concentrated fertilizer is needed to equal the real plant food in a ton of the ordinary 3-3-4 fertilizer. A fertilizer containing 13 per cent. ammonia and 48 per cent. phosphoric acid is now being made in large quantity at Niagara Falls and Warners, New Jersey, but the output is sold abroad almost entirely. One bag of this fertilizer equals 3.69 bags of a mixture of nitrate of soda and 16 per cent. acid phosphate required to get the same amount of actual plant food. The savings in freight and handling costs through use of the concentrated product are readily apparent.
