FARM CALENDAR

Timely Reminders from The Pennsylvania State College

Superphosphate and Manure—Adding approximately 60 pounds of superphosphate to manure in the stable reduces losses of nitrogen and improves the value of manure by adding plant food ordinarily lacking, say agronomists of the Pennsylvania State College. All crops need more phosphoric acid than manure supplies. Superphosphate gives stable floors a clean white appearance.

Winter Cooling of Milk—Cool milk in a tank of cold, pure water, Penn State extension dairymen advise. "Air" cooling is too slow and often results in freezing. This disrupts the milk's physical balance, making an accurate butterfat test impossible.

Care of House Plants—Most farm homes are not well adapted to the growing of house plants, according to extension specialists in ornamental horticulture at Penn State. An even temperature of at least 68 degrees, plenty of moisture in the air, and enough but not too much water, are essential for most house plants.

Testing Garden Seeds—Avoid planting poor seeds next spring by testing germination now, suggest Penn State vegetable gardeners. This can be done by planting seeds either in a shallow box filled with soil or placing them between two blotters which are kept moist and at ordinary room temperature.

Quality Maple Syrup—Equipping buckets with covers to keep out dirt, frequently collecting the sap, and prompt and careful evaporation at the sugar house insure the production of light colored, delicately flavored maple syrup remind forestry extension specialists at Penn State.
