

Of late years the cultivation of strawberries has become general, and the supply increased so enormously, that they are within the reach of all classes of persons.

It is not, however, as generally known, that they are not so good as those raised in the mountains. The ground used to be most beneficial to health, as it is the use of all fruits. Strawberries contain just the combination of acid and saccharine substance needed for warm weather and unwholesome season. They are eaten with effect, and they furnish a small part of ground, can grow more than they can use.

The varieties in general cultivation, are the Wilson's Albany, Agricultural, Triumph De-Grande, Russell's Prolific, Jucunda and New Jersey Scarlet; and either of these, with suitable soil and good clean cultivation, will yield abundantly. The soil should be moist, composed of one fourth sand, with leaf mould and manure. It should not be had, well decomposed muck will answer a good purpose. The beds should be kept free from grass and the creepers well trimmed off. The ground should be covered with leaves, clean hay, or straw, to keep the fruit from the soil, and in the winter they should have a covering of leaves, straw, or corn fodder to protect them from the cold.

RENOVATING OLD HEADWAYS.

John Kealey, of Yardleyville, Pennsylvania, who has an original and successful method of renovating old headways, reports to the American Agriculturist his method of renewing old mowing lots without plowing. "If the surface of the meadow is sufficiently smooth, that is, leveling to moving of the surface, the most effectual way is to harrow it until the soil is entirely loose, using a Kealey's harrow, which has a pole or two of iron rods (that is, one or two) in the harrow, and a heavy iron roller in the front. This should be done immediately after mowing, as the hot sun will kill all the grass roots. Let it be harrowed about once every ten days until about the 25th of August, then spread on fifty bushels of lime to the acre, and harrow it well. Sow the timothy seed about four weeks before the first of September, roll it down, and put up the bars or cut the gate, and you do not get a crop of grass the following harvest, then set down for a humbug. Perhaps some may say that the grass roots will chop up to the harrow; if so, rake them into windrows and set fire to them. It is better to scatter the ashes over the lawn. I dressed up an old meadow of ten acres, in Bucks county, Pennsylvania, and succeeded in raising twenty-five large two-horse loads of clean timothy hay the first crop, where in former years only two loads of trash had been raised, and that by a man who tradition says was 'the best farmer in Bucks county.'"

CLOVER AND TIMOTHY.—A Hadley, in communication to the Northwestern Farmer, gives what he regards as the most important results of his experiments with these two crops. First, the clover being tap rooted penetrates deeply, stands drought, mellow the soil, and the timothy grows much stronger and holds up the clover. Secondly, if sown for pasture, the timothy almost universally prevents the clover from succumbing to a third year, hay is too knotty, especially for cattle, and clover too waxy (succulent), hence both together are better than either alone. To these we may add, under the head of the first that where grass comes in a rotation, it is of the utmost importance, on a clay soil, that it will serve to mellow and loosen the heavy soil in a remarkable degree; so that when sown over with a plow, it will not be so rich, but loose and friable. If, on the other hand, timothy alone be sown, (which some do because the hay sells better,) the soil will turn over heavy and clammy, and be unfit for any crop which is to follow. The grass corresponding to the clover, is that he is partial to ryegrass or sheep pasture, which he occasionally sows in the summer or autumn, after a crop of corn; and then, after being pastured winter and spring, it is turned under for a spring crop—corn is the soil be strong enough—or it may be allowed to go to harvest.

Sowing Grass Seed.—Mr. Phelps Johnson said he had usually made a practice of sowing down to grass with the oat crop; however, any other grain could be used. The ground in put in good condition; then the grain desired to be sown is wet up lightly by stirring it up with water and draining so as only the surface of the grain shall be moistened. Then to every three bushels of oats, turn on twelve quarts of timothy seed and one and one-half pounds of clover, and mix thoroughly. The grass seeds adhere to the kernels of grain, and both can be sown broadcast at one operation. The grass seed is spread very evenly by this method, and is very sure to take. Mr. Johnson thought the grass seed, being in contact with the grain, received considerable nutriment from its decay, and for this reason was sure to take and do well. He remarked that when the seed was sown in the spring previous to the seedling, he omitted the clover, as his soil was natural to clover, the clover coming in too thickly if seed and manure are used at the same time. Mr. Willard said he had tried the method recommended by Mr. Johnson, and found it to succeed well.—Ohio Herald.

HOUSE SERVICE.—Two much important reasons are attached to puddling the roots of trees and plants in clay mortar just before planting. A farmer in La Salle county set a quantity of Orange Range hedge plants one day; at night he placed the plants in mud and planted them the next day. The season proved to be a dry one, and the plants set the first day were an entire failure, those planted last made a good stand. In the ordinary mode of setting hedges, it is very common to have an occasional plant, leaving a gap very difficult to fill in future. By dipping them in mud, then burying up buds thickly, all dead plants can be detected. Plants for hedging should always be assorted into two sizes, setting each size continuously; as when planted indiscriminately the large ones overshadow and kill out the smaller.

Now is the critical period for fruit, and fruit growers should give their trees daily attention. Caterpillars and the curculio may now be destroyed—we have already given you the excellent method of doing so—and the tree now will be a large increase in the yield of fruit. The prospects for fruit in this section is good, and those who fall by neglecting to bestow a little care upon their trees, need to fault only with themselves.

A CORRESPONDENT sends the following remedy for lice in poultry, which he says he has never known to fail: Apply a preparation of wood ashes and boiling water to the roost, and the lice will be destroyed. The remedy will be applied with a broom. Always keep dry sheds where fowls have convenient access to it.

Mr. Deane, in one of his late speeches, is reported to have said that one-half of Scotland is owned by two persons, and one-half England by one hundred and fifty.

"Oh, no! I have been living six-and-thirty years with the queen of terrors; the king can't do much worse."

List of Merchants

Table listing names of merchants and their respective towns, including Hamilton, York, and other localities.

ROBERT C. COBEAN, CHAMBERLAIN STREET, GETTYSBURG, PA.

WILL promptly attend to all orders in his line. Work done in the most skillful manner, and at prices as low as can possibly be afforded to the public.

GAS PIPE

Is supplied with all kinds of Cast Iron, Brass, and Lead Pipe, and is prepared to execute all orders with promptness.

WAGON MAKING.

THE subscriber respectfully informs the public that he carries on the

WAGON-MAKING BUSINESS

in all its branches, at his Shop, in Union street, on the corner of the Hill, and is prepared to execute all orders with promptness.

REPAIRING

OF ALL KINDS ATTENDED TO.

He also manufactures HAND-MADE, SHAKING FORKS AND BROOM-HANDLES, for wheelmen and retailers.

INSURE IN THE HOPE FIRE INSURANCE COMPANY OF YORK, PENNA.

OFFICE: Hartman's Building, Centre Square.

CHATELAIN CAPITAL

OF \$100,000.00. AVALIABLE ASSETS \$25,000.00.

DISKS OF EVERY DESCRIPTION

FOR PERIODS OF YEARS, at low rates, as low as the market, and on accommodating terms with any Company in the city.

NO PREMIUM NOTES

ARE TAKEN IN THIS COMPANY, and no portion of the entire stock is conveyed by the stockholder, which is a guarantee that the stock will be as good as cash.

INSURANCE CREATES INDEPENDENCE

A person who insures his property, is independent of the will of any other person, and is enabled to do as he pleases with his own property.

INSURANCE ON THE LIFE OF A PERSON

IS A GUARANTEE THAT THE MONEY WILL BE PAID TO THE BENEFIT OF THE SURVIVOR, and is a most desirable mode of accumulating wealth.
