### Value of Corn Fodder.

Dr. Nichols, in the Journal of Chemis

try, says: The opinion we have always held upon the question of the green corn fodder for milch cows has been that when raised from broadcast sowing it is nearly worthless, but when sown in hills and drills, and replaced cultivated, with access of air and sunlight, it is of high value. During the present season we have made some experiments to test the correctness of these views. Stalks were collected from a field where the seed was sown broadcast, and also stalks growing in drills upon the same field, and they were dried in a drying closet, to expel the moisture. Both specimens were planted at the same time (May 6,) and it was found that the broadcast sowing contained ninety-two per cent. of water; those from Thus it was shown that the difference of solid matter in the two was relatively as eight to seventeen per cent. The solid matter was composed of starch, gam, sugar, and wooden fibers. There was almost an entire absence of sugar and gum in the stalks from the broadcast sowing, while the seal of the Fode the stalks that had grown under the influence of light and air, held these nu-trient principles in considerable quantities. The stalks were collected at the period of growth just before the ears begin to form,

The present agreement is to take effect on the 1st. April, 1872, and on and after that date section 5 of the growth just before the ears begin to form,

Detailed Regulations of the 2nd and 26th of July, 1864, and the absolute of the 2nd and 26th of July, 1864, and the absolute of the 2nd and 26th of July, 1864, and the absolute of the 2nd and 26th of July, 1864, and the absolute of the 2nd and 26th of July, 1864, and the absolute of the 2nd and 26th of July, 1864, and the 2nd and 26th of July, 1864, and the 2nd and 26th of July, 1864, and 1864 a period when most farmers begin to cut

Our experiments upon corn fodder have afforded us important information upon other points. We find that the stalks cut before they reach a certain stage of growth are deficient in putrient. are deficient in nutrient matter, and therefore it is a waste to feed them too early. The corn plant, like all other vegetable structures, has but one object or aim in its growth, and that is to produce seed. It is engaged during its whole life in storing up large quantities of starch, which is to be used when the pressing occasion arrives, or the seed-vessels mature, to form by some subtle, mysterious changes, the rich nutrient principles which are found in seeds. As soon as this struggle is over, the cornplant, like all annuals, dies a natural death. It is not necessary for frost to strike it; it dies from simple exhaustion. The proper time to cut and feed corn stalks is during the four or five weeks succeeding in the four or five weeks succeeding in sent and start or of the sent and sudor the procession of section eight of an action of the relief of freedom and refuges, and for other purposes, "approved June classes of a suchol-farm lands under the procession of the relief of freedom and refuges, and for other purposes," approved June classes of a suchol-farm lands under the purpose, and for other purposes, in approved June classes of a suchol-farm lands by the direct-tax commissioners for the district of South Carolina, under the instructions of President Linciples of the control of the research of the direct-tax commissioners for the district of South Carolina, under the instructions of President Linciples and the control of the Toestra of the Carolina, in the control of the Toestra of the Carolina and the such as the such retained as a fund for the use and support of fee schools in the parishes of Sain Helens and Sain florescence, or in other words, they should not be until the flower is fairly developed, and the ear commences to form; and any corn that is so planted, that the ear cannot form and mature, is practically worth. corn that is so planted, that the ear cannot form and mature, is practically worthless as fodder. Farmers may learn from these facts that corn designed to be cut for fodder, should be planted at two or three periods during the season; some fields out. fodder, should be planted at the order of periods during the season; some fields quite early, others somewhat later, and still somewhat later, and still add the same and the same and the same and the same as the same and the same and the same as the same and the same as the same and the same as the same a others as late as is safe. In this way, when the hot, dry months of July and August hies are reached, and the pastures fatter, a supply of fodder is secured at a proper stage by the president of the united states of America. of growth, to afford the largest amount of

By THE PRESIDENT OF THE UNITED STATES OF cow, it will then bring so much more as beef.

If milk can be spared from the pigs, it will pay to give the calf nothing but skimmed milk for drink, with a liberal allowance of meal and cut hay. We think we have, during the past Winter, obtained a better return for our sour milk in this this way than by turning it into pork at present prices.

## Rules for Care of Sheep

Keep sheep dry under foot with litter. Keep sheep dry under foot with litter. This is even more necessary than roofing them. Never let them stand in mud or snow. Drop or take out the lowest bar as the sheep enter or leave the yard, thus saving broken limbs. Begin graining with the greatest care, and use the smallest quantity at first. If a ewe loses her lamb, milk her daily for two days, and mix a little ailum with her salt. Give the lambe a little milk feed in time of wenning. lambs a little milk feed in time of weaning. Never frighten sheep, if possible to avoid it. Sow rye for weak ones in cold weather, if you can. Separate all weak, or thin, or sick, from those strong, in the fall, and give them special care. If any sheep is hurt catch it at once, and wash the wound hurt catch it at once, and wash the wound with something healing. If the limb is broken, bind it with splinters tightly, loosening as the limb swells. Keep a number of good bells on the sheep. If one is lame, examine the foot, clean out the hoo's, pare the hoof if unsound, and apply tobacco with blue vitriol boiled in a little water. Sheer any sheep commencing to shed its wool, unless the weather is too severe.—

Northwestern Farmer.

# External Painting.

The Technologist says :- "The best time for painting the exterior of buildings is for painting the exterior of buildings is late in autumn, or during the winter.—Paint then applied will endure twice as long as when applied in early summer or in hot weather. In the former it dries slowly and becomes hard like a glazed surface, not easily affected by the weather, or worn off by the beating of storms. But it in het weather the oil in the paint soaks into the wood at once as into a sponge, fleaving the lead almost dry and nearly ready to drop off. This last difficulty, however, might is a measure be guarded against, though at an increased expense, by first going over the surface with raw oil. By painting in cold weather one annoyance might certainly be assaped—namely, the collection of flies and insects on the fresh paint."
