

Agricultural.
Buildings.—Every thing ought to be put in order for cold weather. Earth may be banked up against the foundations of cellars. Stables may be boarded up on the inside, and the space filled with straw or leaves. Tighten the weather-bowling where it is loose. Set glass where panes are broken, and look to leaks around chimneys, holes in the roof, etc.
Bees.—Should be withdrawn from the pastures, and put in their regular quarters. They will begin pushing now to the utmost.
Cows.—Feed succulent, milk-producing food, and be sure that they are not overfed. Stables to be kept themselves and trouble of milking. Keep the stables very clean, and feed them liberally if there is any danger of their being short of food. A narrow strip of bone meal to their daily feed, of which they will eat, and which should form a part of feed pumpkins without seeds will do the best.
Young Cattle.—Keep them in open yards with plenty of cut, and deep, warm sheds in which they will be secured from the effects of storms.
Sheep.—We provide for April lambs this month, and both rams and ewes should be in good condition. Feed roots cut up, oil meal, or grain-meal occasionally to the ewes, and in the case of bone meal to their daily feed, of which they will eat, and which should form a part of feed pumpkins without seeds will do the best.
Horses.—If possible, have the stable arranged so to be more easily cleaned than neglected. Young horses ought to be stabled and as carefully groomed as older ones. The horse's hair is in a great measure shed in his first winter. Nothing will compensate for neglect. Old horses, especially those that have been overworked, may have the range of a piece of woodland or brush pasture until snow comes, and will do well if the grass and bushes have been cut down to close by sheep and other horses. Horses do well at least early in the season, on corn stalks, and will often eat them down to the roots. If cut short, they will give the horses sore mouths.
Sows.—Fatten upon boiled potatoes and meal, or more easily let them work cook all the feed of fattening sows. Breeding sows that have got their full growth need not be fed much grain.
Cattle.—In a great measure, the sheep in the sheaf or stock, but corn should be husked and wheat thrashed and stored in rat-proof granaries as soon as possible. Market at fair prices rather than hold.
Corn.—It is time now to have all the corn husked and stored in airy cribs. Stack the straw in a dry place, and if water, store in the b-rn under cover, if there is room, as they retain flavor longer.
Cabbages, if not marketable at remunerative prices, make excellent milk-producing fodder. Put them in the barn, cellar, or in trenches for winter use. All cabbages should be stripped off and given to the hogs, or the milk will test.
Potatoes in pits in the open ground may have been planted, and if they are to be reduced as the weather grows colder, and just before the ground freezes up solid, the hogs must have their last crop of earth, and not be fall plowing.—Do as much mowing as possible, particularly of land likely to be long in the spring. If plowed it will be fit to work earlier.
The Water Supply for cattle is a serious consideration. Much manure is lost by living cattle to water. Cisterns, etc., should be cleaned out and put in order, to be filled with pure water before spring. If the supply to draw from springs flowing with pipes, look to the condition of the fountain, and clean it out after the leaves fall.
Roots.—Before storing, expose them in small heaps for several days, to "sweat" off their superabundant moisture. Top them without cutting the flesh, and store them as possible.—*American Agriculturist.*
Fattening Hogs.—When hogs are fairly on their way of being fattened, receiving several times a day all the water they can drink, the more they can be made to eat the faster they will fatten and the more profit the farmer will derive from the food given them and consumed. In a certain neighborhood of good farmers, as to who should fatten the fattest hog. Each one took a pig of the same size and they all started alike. But somehow it turned out that one certain man always came out ahead. This man was a stranger, and he got the secret leaked out. The successful farmer was in the habit of giving his pig all it would eat, and then turning it into his pen another hungry pig, which of course would commence feeding voraciously. This would arouse into action the sluggish stomach of the other pig, and he too would turn in eating with eagerness and resolutely competing with the hungry one. By this means the hog that was being fattened was stuffed several times a day to repletion. Now, as we have found by experience that the fattest hog that a hog can be induced to eat much more than he otherwise would and consequently be made to eat fat very fast. Let a hog, for instance, eat until he will eat of corn on the ear. When his trough half full with clean water, and straw into his trough three or four quarts of shelled corn, and it will be that the hog's appetite will come to him again, and this additional amount of food will also be consumed. It is generally the case that those hogs which do not take on fat very rapidly are poor eaters, and it is an object of importance, worthy of the farmer's attention, to make them full eaters. Every fattening hog, which is really thriving satisfactorily, will always denote that by this pillar snuffling and difficult breathing, just after eating all he will eat. And perhaps it will be found that even scrub hogs, about which so much complaint is made for their shyness in taking on fat, can be made to give much more satisfaction in their fattening means are taken to make them greater eaters.
STEAM PLOWS.—There is now five English steam plows running in this country; one in Kentucky, one in Texas, and three in Louisiana. They cost about \$15,000, and gave great satisfaction, as they do the work of twenty or thirty horses with the labor of two or three attendants. They run a gang of four to six plows, and pulverize as deep as four inches, and they can go much deeper if the farmer wishes. Two or three inventors are working on the English steam plow. One proposes to build, for about \$3,000 an engine that will move back and forth on the line of a wire rope fastened at the headlands to a self-advanced anchor.
