

**Agricultural.**

ODE TO HORTICULTURE.

THE day two hundred years ago  
The wild grapes by the river side  
And nestles on the ground, and  
The table of the woods supplied.

Unknown the apple's red and gold,  
The blushing fruit of peach and plum;  
The mirror of the bayonet field  
Or the rainbow of the rainbow.

Wild as the fruits he seemed to till,  
These were the life of his domain;  
Not knew the gold, creative skill,  
The joy of him who tills with soil.

Oh, Patriot of the fruits and flowers,  
We thank thee for thy wise domain,  
Where these human hands of ours,  
In nature's garden work with thine.

And to thee, from our daily bread  
The joy of home and hearth,  
That who sees the summer's end  
May find the fruit of autumn's end.

Give to his gold, and give to his power,  
Let fortune fables be and all;  
Who some to us and some to us,  
Or plants a tree, is more than all.

For he who tills the soil, is best;  
And God shall give us all;  
Who tills to leave us a home,  
And a home to leave us all.

And so, in fact, is that that best,  
The fruit of home and hearth;  
The flowers shall bloom, the fruit shall grow,  
If on our earth, at length, is heaven.

SOMETHING ABOUT BUTTER MAKING.—We notice in the *Age* and *Register* an interesting communication from A. W. Chittenden, Genl. of Massachusetts, which contains some valuable information on the subject of making butter, some of the points of which will be found among our articles.

Butter is composed of fat or oil case and curd mixed together. Good butter should contain at least 82 per cent. of oil. The oil or fat of butter, like lard and other fat, is composed of solid or margarine fat and oleine fat.

Water butter contains, according to Prof. Thompson, of solid fat, 55 parts in 100, while ordinary butter contains only 40 parts. This fact explains the reason why cream should be churned at different temperatures in different seasons of the year.

When it is churned at such a temperature, that when it is done it will gather well. Not so cold that the butter will be in curds that will not stick together, nor so warm as to be greasy. Fresh, sweet cream will not churn as quickly as that which is sour. In winter, it is churned at 60 degrees and then placed in a room where it will be warm enough to have the whole get slightly rancid.

It is churned up again in the same way to the desired temperature for churning. Cream is kept in large tin pails, the day before churning, and is kept together as evenly as possible, so that no fresh cream will be in a pail by itself, and wanted over to be churned.

It is churned up again in the same way to the desired temperature for churning. Cream is kept in large tin pails, the day before churning, and is kept together as evenly as possible, so that no fresh cream will be in a pail by itself, and wanted over to be churned.
