TIMELY HINTS TO HUSBANDMEN.

Rural and Household Hints—The Effect of Land Monopoly.

Germania Telegraph.

The aesthetic plant, the sunflower, is

extensively grown in the mountainous

this summer, and the disciples of Oscar

Wilde gaze upon it with undiminished

admiration.

If the heads of horses exposed much to

the sun were protected with a "bonnet"

during the day, it would add greatly to

the comfort of the animals. An arrange-

ment of this kind for shading the head

was extensively used a few summers ago,

but it is now only rarely seen.

In warm weather the confined air of

closets and refrigerators becomes un-

wholesome and seriously impairs the

quality of milk, cream, butter and such

other susceptible articles kept there.

Charcoal is an important disinfectant, and

a small dish of it kept in these confined

places will purify the air and preserve the

food in a wholesome condition.

Superior grape vine in the Tokay

vineyard, near Fayetteville, N. C., it is

said, bears 100 bushels of grapes. There

are other vines in the same vineyard which

produce from 25 to 40 bushels. The vines

were planted twenty-five years ago. The

form of the grape is not adapted to the

climate as far north as the Middle States but

in the Southern States it is the principal

dependence for wine, though scarcely fit for

the table at all.

It is proclaimed that there has been

discovered a substitute for Paris green as

a destroyer of the potato beetle, which unlike

the established destroyer, is entirely harm-

less. This is said to be gas tar and water.

Mr. S. H. Hart, of Brighton, N. Y., claims

to have used it upon his potatoes with en-

tire success. He puts two quarts of tar

into an ordinary bucket and fills it with

water. After stirring thoroughly it is left

to settle, and then applies it to the vines

with a watering pot. It is easy to do, is

cheap and is harmless.

Oxen and Horses.

A contemporary says: "One of the

many curious facts to be found in the cen-

sus reports is that the number of working

men in the United States has decreased

in the last ten years by 25 per cent. since

1870." On the contrary, we do not think that

there is anything curious in this at all.

If the writer of these quoted lines was

a farmer or teamster, he would think differ-

ently. We regard the oxen as entirely

inferior to the horse or mule as draft ani-

mals, either on the farm or road. We

know that oxen are worth nearly as much

for the shambles at the end of six to eight

years as at any other time; but they can

be used only about one-half as long

as the horse. On our farms we use the

best that we can procure, more than two-

thirds to three-fourths the amount of work

owing to their slowness of movement and

awkwardness in handling. Hence the reduc-

tion in the percentage in the number of

oxen on all double and triple teams in

the country progresses, without in the

least degree there being anything "cur-

ious" about it.

Incubators.

A year or so ago we were led to inquire

whether any incubators were in successful

and profitable operation. As we received

no response, we suppose that nothing yet

of any consequence has been found out

of the knowledge that eggs may be hatched

by artificial means. We are the more in-

clined to believe that no practical use has

been made of the idea, to any extent, from

seeing in the schedules of one of our lead-

ing poultry exhibitions, handsome pre-

miums offered for successful incubators,

while so far as we have been able to see,

no reports of anything valuable being

offered has appeared. Taking it for granted

that there is a considerable number of

incubators have been a failure, it is

worth while inquiring why they should be

so and whether something cannot be done

to remove the difficulties.

We know of nothing more likely to be

profitable for a regular succession of

good young chickens, through all sea-

sons of the year, would bring with it a

sure market; and unless the losses should be

very large in some unaccountable way it

could not but pay well.

We suspect that the trouble must be

that the young chickens are not raised as

easily without as with a mother's care.

Even when the chickens are brought up

by the hens that hatch them, it is by no

means a certain business. Very few are

the persons who can boast at the end of a

season of having raised all the chickens

hatched; while it is not at all uncommon

for people to lose a third or even a half;

and we suppose that under absolutely arti-

ficial treatment the loss would be greater

still. Nevertheless, those who have had

experience in this practice could perhaps

tell us exactly how it is. We like to hear

the details of failures, as well as to have

accounts of success. Very often when one

reads of the failure of another, the cause

occurs to him when it may never strike the

one who fails; and in this way the one who

tells of what he has failed to do, often does

as much or more good than one who shows

what he has successfully done. Indeed, it

is more often than not that people think

they can succeed where another fails, and

some even, who could never think to try

what some one else has done, will at once

tell us exactly how it is. We like to hear
