HOP PLANTER

compared the earthquake reports received from different quarters, said to a representative of the New York Herald: "By charting the figures, I find that they can be plausibly connected by the hypothesis that an earthquake vibration started some distance beneath Long Island and moved northeastward toward Boston, at the rate of about one hundred miles per minute, reaching Cambridge at 2:07 p. m., and southwestward toward Washington at the same rate, reaching there at 3:12 p. m. Or, again, the observations are, with equal plausibility, represented by assuming that the shock started nearly simultaneously from two points-say beneath New York and Philadelphia, whence the waves pro-ceeded northeast and southwest. Either these conclusions would be in accordance with what we know of the nature of earthquakes, but the former seems to me preferable.

there are, I think, but two allowable hy-pothesis as to the nature of the origin of the shock. Either sudden, evolution of gas or a sudden dislocation of strata takes place within this cavity a few m les below the earth's surface. That cavities al-ready exist is abundantly evident, and if with very hot sides, becomes suddenly partly filled with water the result must be This is probably the class of earthquake that attends volcanic cruptions. On the other hand we have throughout the world, and nowhere better than in our Middle Atlantic states, illustrations of geological strata I displaced, dislocated, set up edge-wise and broken by seams and faults, showing that the solid earth in the process of cooling during past ages has shrunk to slightly smaller dimensions, crumbling the strata into ridges such as those out of which the Appalachian chain has been formed. The operation has been a very slow one. Little by little a great extent of rock would come under a severe strain. Finally parts of it gave way. A dislocation of a few inches relieved the strain temporarily. But this sudden dislocation would be felt over the neighborhood very much like the yielding

and snapping of the floor of an ill-con-structed and overgrowded ball room or an The Use of Earthquaken "This, which Professor Mallet recogalzes as a true physical cause for the earthquake, shows us that this dreaded shock is really the instrument by means of which the solid crust of the globe is protected from more terrible catastrophes. The longer such shocks are delayed the more intense becomes the accumulated strain in the interior and the more terrible must be the shock and reaction when it comes. This, I take it, is the true nature of all the numerous earthquakes on the Atlantic coast, for on the very surface itself we see this process going on. A perwhere the splitting off of a great slab of materials rock was always accompanied by the sud den expansion of the neighboring parts, as though relieved from great strain, Again the remarkable noises and slight therefrom." shocks in the neighborhood of Bald and Round mountains, North Carolina, in February and March, 1874, were traced very plausibly to the production of slight faults of the rocks. Similar phenomena occur continually in mining regions. All that our superficial geology can teach us about the condition of the strata a few miles below the surface proves that these

ones may be forming every day. least four regions-namely, Georgia, Pennsylvania, Connecticut and the Lower St. Lawrence-beneath which Professor Mallet's 'crushing down' phenomena are especially frequent. If we may judge from the fact that these are the recog nized centres from which slight earthquakes are perpetually emanating, it will greatly facilitate our study of these phenomena. If self-recording barometers and electrometers or special forms of selfregistering seismometers can be netroduced at many statious, if the signal service had authority to include eathquakes within its work, there is no donot but what it would soon be able to predict them at least as well as has been done for Mount Vesuvius by the earthquake ob-

servers at that place." The Theory of a Solid Earth. Professor William Harkness, of the United States naval observatory, in answer to questions respecting his views on earth quakes and their relations to the physics of the globe, said : "In attempting to account for earthquakes it is tirst of all necessary to have knowledge, or at least a well defined theory of the internal structure of the earth. And here at the cutset astronomers and physicists on the one band and geologists on the other differ widely. The geologists assume that the earth was originally in molten condition, and that in the course of ages a solid crust has formed on the outside, leaving a molten interior. And further, from the numerous fossil remains found imbedded in the rocks, it is inferred that uncounted millions of years have been consumed in the process. The astronomer and physicists starts from entirely different promises. He weighs the entire amount of matter in the sun and planets composing the whole solar system, then imagines it all converted into gas and engendered into a nebulous cloud, filling all space. They by mathematical processes he is able to compate the total amount of heat which compate the total amount of heat which compare the total amount of heat which compare the total amount of heat which compare the total amount of heat which compared the total amount of heat which compar would be generated by the condensation of this nebulous mass into a body the size of the sun, and dividing this quantity by the total amount of heat emitted by the sun in twenty-four hours an approxima-tion to the entire possible duration of the And is favorably known and used in all parts of the world. The sick or alling should not delay its use. It will prevent as well as cure disease. Its price is one dollar per bottle, or six bottles for five dollars. Ask for it and see that you get it. It is for sale by all Druggists, and by the OREGON INDIAN MEDICINE COMPANY, Corry, Pa.

tion to the entire possible duration of the solar system is obtained. The conclusion arrived at is that it is unlikely that the solar system has existed in its present condition for more than twenty five million years, and it seems impossible that it can have existed so long as fifty millions of have existed so long as fifty millions of

years, which, as the geologista reckon time, is but an instant. posed by all scientific men that the interior of the earth is in a molten condition. But the application of more refined analysis to the mathematical discussion of the tides has shown that this view is untenable. If Toothache in one minute, Headache in five which at any moment is turned toward the minutes, Earache in ten minutes, Sore Threat sun to be covered with a sore and covered with sun to be covered with grass, and each

case of the earth, it would obliterate the tide, and the fact that the tides are not obliterated, but have nearly their exact theoretical height proves beyond question that the earth is not sensibly deformed by the sun's attraction, and shows that the average rigidity of the earth is not very different from what it would be if the earth were a globe of solid steel. Under such circumstances it is difficult to believe that the interior is plastic or that volcanoes are more than local phenomena.

suggested that they may sometimes be due

to the falling in of subterranean caverns produced by the action of water dissolving extensive deposits of rock salt, limestone, gypsum or other similar materials. It has also been supposed that they may sometimes be due to the rupture of rock masses in the interior of the earth, perhaps aided by the injection of volcanic materials thrown into the crevices thus produced. "Another theory that has had great vogue is that they are due to t e crushing of rock masses by the contraction of the earth as it continues to cool. But this assumes that the whole interior of the earth is heated, which we have already seen to be a questionable hypothesis. Although it seems rash to say that earthquakes are dependent upon volcanic action, it is nevertheless clear that both earthquakes and volcanoes are due to some common cause, and as the great earthquake regions and the great volcanic regions are nearly coincident with each other, and almost without exception in the neighborhood of the sea, there seems some reason to suppose that steam generated at a consideraable depth by the internal heat of the earth may play a prominent part in the phenomena."

Not Alone Due to Contraction

Major John W. Powell, director of the geological survey, said: "For many years geologists have attributed earthquakes chiefly to a contraction of the interior as in a fluid condition, and that this state is due mainly to great heat. * * * But it is not believed that this contraction is MONDAY, Aug. 18, 1884. sufficient in quantity and rate to account by itself for earthquakes and all of the facts connected therewith. All the land portions of the earth are rapidly washed down by rains and rivers, and the material of the land thus carried to the sea. By this method all the land portions of the earth are steadily unloaded at a rate surprising to those who have not carefully studied the subject. At the same time the material thus carried away is loaded upon the borders of the seas, a very small amount being carried to the deep sea. This unloading and loading generates stresses in the crust of solid rock. As the process of loading and unloading continues the stresses cumulate, until at last the solid crust suddenly yields along some weak point. In areas of unleading the yielding is usually by fracture of the crust and upheaval. This sudden fracture and upheaval is the cause of many earthquakes, and such earthquakes are usu ally remote from districts of active volcanoes. In those regions of country where votcanoes are in operation the fleode feet illustration of it is found in the phenomena investigated by Professor on to the surface of the earth would leave Niles in the quarries in Connecticut, hollow spaces beneath the crust, were the to support the arch above. But, being anequal to the task, they yield and sink, and another class of carthquakes result

Will Not Return for Many Years. meteor was at least one hundred miles

from them " Turning his attention to eyclones, the professor said that many scientists attribute them to electricity, as do many attribute earthquakes to the same source. "In spite of the possible similarity of causes," he said, "I can't see any possible connection between the two, but I believe it to be settled that the primal cause of

Every rerson to be a Real Success In this life must have a speciality; that is, must concentrate the abilities of body and a lind on some one pursuit. Cause of Earthquakes "We know little as to the real cause of earthquakes, but they are doubtless due to concussions of some kind or other taking place in a very great depth below the surface of the ground. It has been

"I don't think there will be a recurrence of the earthquake for many years," said Professor Lowis Swift, director of the Warner observatory at Rochester, N. Y., for the reason that earthquakes very seldom follow each other in close succession in this country as they do in others. I think that what we hear about the rumb ling notes accompanying earthquakes, should be taken with much allowance. There never was a meteor passed through the air but what three quarters of those who saw it thought they heard a whizzing noise. Such a belief is absurd because they never make a noise until they explode or strike. The last meteor in this section was on July 3 I have a peck measure full of letters from people in this vicinity who all assert that they heard a hissing sound. That of course is absurd, for the

carthquakes is the internal heat of the Suckien's Arntes Saive.
