her respects, as she often did of yore, while admiring Philadelphians gaze on the pretty spectacle. The meeting is scheduled for tomorrow night, at 10 o'clock, at a certain spot in the northwestern portion of the heavens.

It is, in astronomical language, a conjunction between the two planets. Venus, moving comparatively swiftly eastward across the sky, will overtake the slow-moving Jupiter at 10 p. m. For a theoretical instant they will be in conjunction, and to many eyes will present the spearance of one large and brilliant star. Discerning eyes, however, will see that a distance about two-thirds that of the full moon's disc will separate them. And all the glamour fades when one learns that some 430,000,000 miles actually separates the planets. Jupiter being that distance beyond Venus, the evening star of Tennyson's "Crossing the Bar."

As seen from the earth, Venus moves much more swiftly than Jupiter, according to Prof. Eric Doollitte, of the University of Pennsylvania School of Astronomy, because she completes her orbit around the sun in 255 days, whereas
