## RESINOL

Something and Healing some ointments irritate sensitive skin while healing it. Resinol produces only cool comfort while clearing away skin trouble

Make the treatment complete. Use Resinol Soap.

Here is the easiest hook-up for what is known as a "single circuit regenerative" set. It is fully explained in the accompanying article. You will see the letters "F. F. P. Q." on any socket you buy. The two "F"s mean filament, the "G" grid and the "P" plate.

#### The Simplest "Regenerative" Hook-Up

All radio fans talk about "regenerative circuits." In every radio magazine you will see it stated over and over again that the regenerative circuit is the best circuit for the reception of signals sent out on such short wave lengths as are used by the broadcasting stations.

I've prohibited not to be too technical in these articles, so we won't go into the details of regeneration too deeply. Whenever you see a diagram of a hook-up stating it is employing this principle, you can get ahead safely and use it whether you understand why it is good or not. And any diagram which shows a coil marked "tickler" is a regenerative circuit.

Briefly, the tickler is a coil of any kind used to take the current from the dry cell, or "B" battery, and "feed it back" to the original, or primary, coil that the aerial hook-up to—the "feed back" being done in such a way that the battery current, by its own strength, gives added strength to the weak currents coming in through the aerial. The result is a signal built up considerably beyond the strength it would have had if it hadn't been tickled. The tickling seems to make it laugh louder in joy.

You needn't be worried if you cannot quite see how this is done. You can operate a set successfully without a clear idea of it.

Any kind of a coupling coil, if hooked up properly, can be used in the form of a regenerative circuit by the diagram shown here. All coupling coils have two binding posts marked "aerial" and "ground" (which are simply the two ends of one coil known as the "primary") and another pair of binding posts for the coil known as the "secondary."

If you are using a loose coupler or honeycomb coils or homemade spider web coils, simply substitute them for the "variometer" shown in the diagram.

The secondary coil then ceases to be a secondary, and becomes a tickler, and the circuit becomes a regenerative circuit.

There is one interesting point about this, though. If two fellows are using the same aerial, the fellow in one house using one wire and the fellow in the other house using the other, neither one must use this circuit. Any circuit which eliminates the secondary coil becomes what is known as a single circuit hook-up, and the odd part of a single circuit hook-up is that, all the time you are using it to receive on, you are, unknown to yourself, sending out a steady stream of oscillations which will cause a loud hum in any nearby aerial and interfere with your neighbor's reception of the broadcasts.

If you and your neighbor are using the different wires of the same aerial or if your neighbor's aerial is very near to your own, you had better sign a truce, both agreeing to use one of the regenerative circuits which provide for a secondary coil. Then you won't interfere with each other.

This circuit is not the standard regenerative circuit which is usually meant by that term. That hook-up requires two "variometers" in addition to the coupler, and in that case the extra coil of the coupler is used as a secondary.

The hook-up given here is more complicated than the usual one, but is much simpler in operation. The standard one is simpler in wiring, but much more difficult to operate successfully, because it has more adjustments. This one is easier to find signals with, but is not so "selective" that is, if there are other stations sending out the same wave lengths, it may be impossible to "tune them out" with this hook-up, whereas, if you know how to use the standard regenerative circuit, you can tune out almost anything you don't want to hear.

But this circuit is by all odds the best for the beginner, and its great advantage is that it is cheaper than the other, and that all the instruments used here will also be used in the standard hook-up when you buy your two variometers and try it.

### "Z-Z-Z-Z, COME ON, FELLOWS," MOTH'S MESSAGE BY RADIO

"Here's Another Rug We Can Chew," Might Be Typical Communication if City Entomologist's Theory Is Correct

The big white moth seen flying about a room may be in radio communication with another moth a mile away, according to Herman Horng, city entomologist.

"Z-z-z-z, come on, fellows, here's a fine new rug we can chew," might well be imagined as the message flashed out. Interest in the mystery of insect communication was revived recently by the discovery announced by a former sergeant major in the army. While experimenting overseas with radio he claims to have discovered that the humble cockroach can "wireless" his messages with a wave length of one and a half meters.

"Preposterous, absurd," were some of the comments made. But Mr. Horng does not think so. He has experimented himself with moths and mosquitoes.

The male moth, Mr. Horng declares, has antennae, or projections from the head, which resemble a wireless mast with aerials.

The female moth's antennae are less highly developed, according to the entomologist, although the female has a more powerful "sending" organ.

Mr. Horng describes as "ether rays" the mysterious emanations, he says, streams from the body of the female when she is calling a mate. He said his conclusions are based on exhaustive experiments.

In his experiments with mosquitoes, Mr. Horng placed a female in one glass jar and a male in another glass jar some distance away. He said that when the female began "buzzing" a message

### THIS CHILD'S LIFE IS IN THE HOLLOW OF YOUR HAND!

In your hand today is the life of a little child. Only YOU can save it. Which will you give—LIFE or DEATH?

Half-worn clothing that you will never use again will keep the warmth of life in a naked, freezing little body. Thousands died in Armenia last winter because they had no clothes. As the spring snows melt they reveal the bodies of those who perished.

There are a million and a half homeless wanderers in the Near East. In October the snow begins to fall. Added to the pangs of starvation will be the agony of almost Arctic cold. What chance have these people and their children—shelterless and half naked as they are?

Without our aid multitudes will die. YOU can help to save them on

### BUNDLE DAY WEDNESDAY, MAY 3

Near East Relief, incorporated by Congress, will transport and distribute without cost the clothing you give.

Every School Will be a Bundle Station

Search your closets today. Get your worn clothing—the garments that you have put away in trunks, closets, attics because they were useless. Warm clothing of every size and kind is desperately needed for men, women and children.

## Don't Forget BUNDLE DAY Wednesday, May 3

N. E. Corner Broad and Locust Sts.

**NAB 2 IN SALOON ROBBERY**  
Bartender, Who Was Assaulted and Knocked Out, Identifies Pair

Two men entered the saloon of Lewis Castle, 326 North Tenth street, knocked down James Hammond, the bartender, with a blackjack and grabbed \$13 from the cash drawer. Hammond was alone in the place at the time. He was later sent to Hahnemann Hospital with a deep cut in his head.

A short time later Daniel Rodgers, 32 North Eleventh street, and M. E. Porudis, 6028 Woodland avenue, were arrested at Eleventh and Arch streets, charged with the hold-up. Hammond identified them.

**DOCTOR SHOT DEAD BY SON; WIDOW SHIELDS SLAYER**  
Victim Said to Have Been Choking Invalid Wife

Athens, Tenn., May 1.—(By A. P.)—Dr. Gus Shipley, fifty-two, member of the Tennessee Board of Medical Examiners and one of the best-known physicians in the State, was shot and instantly killed here last night by his son, Jack Shipley, a deputy sheriff.

According to the son's story, his father was choking Mrs. Shipley, who is an invalid, recently having had one of her legs amputated, when he stepped up behind him and fired a shot into his neck.

Mrs. Shipley made a statement defending her son, saying he was forced to shoot and plead with officers not to arrest him. Father and son when seen on the street together yesterday seemed on the best of terms. No previous trouble is known to have occurred between them.

Young Shipley surrendered immediately after the shooting, but was not placed in jail pending an investigation by a coroner's jury today.
