The parties racing up and down the highway about midnight on Saturday night on motorcycles may have been entertaining themselves and their friends, but they probably didn't stop to think that what was amusing to them may have been annoying to the residents. Also, they were burning up fuel that could have been used for something essential.

It seems to us that there is sufficient food available even if we do not get so many luxuries, and that lack of food in enemy countries and our ability to supply it is a strong weapon on our side. So when we are making unreasonable demands off the groceryman let us just think that we could help our armies in conquering the enemy by sharing food with them.

The daily vacation Bible school is well attended and very successful. The minister and teachers are very much encouraged but sorry that all the children in the community could not attend.

HOW TO HOLD FALSE TEETH
MORS FIRMLY IN PLACE
Do your false teeth annoy and embarrass by slipping, dropping or wobbling when you eat, laugh or talk? Just sprinkle a little PASTETEETH on your plates. This alkaline (non-acid) powder holds false teeth more firmly and more comfortably. No gummy, soapy, pasty taste or feeling. Does not sour. Checks "plaque odor" (denture breath). Get PASTETEETH today at any drug store.

Hot Soapsuds, Water Kills Influenza Viruses the Best

Soapsuds and hot water are more effective in killing influenza viruses on dishes than are many cleaning agents commonly used in dishwashing. This is the report made by Commander Albert Paul Krueger, in command of Naval Laboratory Research Unit No. 1, which for the past two years has been investigating epidemic influenza in the field and in its laboratories at the University of California. The laboratory occupies space allocated to it on the Berkeley campus, and practically its entire staff has received training on some campus of the institution and several members held faculty appointments. Commander Krueger formerly was professor of bacteriology and lecturer in medicine.

Tests were made to determine the effect of representative cleaning agents upon types A and B influenza viruses. While these two viruses can be classified as entirely distinct types by laboratory procedures, they cause essentially the same disease picture in humans.

It was found that certain cleaning agents commonly used in dishwashing and depending upon trisodium phosphate for their efficiency have no destructive action on either type of virus. Similarly, negative results were obtained with a synthetic penetrant and with a synthetic high molecular detergent noted for its powerful action upon a wide variety of disease-producing organisms. In contrast, a 1 per cent, or one tenth of 1 per cent solution of general purpose soap rapidly inactivated the viruses.
