WHAT TEARS ARE MADE OF.

Those of Joy and Grief Are Just the Same and Are Mostly Water. Brooklyn Standard. ] The principal element in the composition of a tear, as may readily be supposed, is water. The other elements are salt, sods, phosphate of lime, phosphate of sods and mucus, each in small proportions. A dried tear seen through a microscope of good,

average power represents a peculiar appear-ance. The water, after evaporation, leaves behind it the saline ingredients, which amalgamate and form themselves into lengthened cross lines, and look like a num-ber of minute fish bones. The make-up is ber of minute fish bones. The make-up is just the same whether the tears are for joy ance to a great extent and now he is master.

The discharge of tears from the lachrymal glands is not occasional and accidental, as is commonly supposed, but continuous. It goes on both day and night—though less abundantly at night—through the "conduits," and spreads equally over the surface of the lids. After serving its purpose the flow is carried away by two little drains, cituated in that corner of sechemans.

Hardly had it left the North Wakefield station when the engineer saw a woman on the track, frantically waving a white cloth. Evidently there was danger ahead. The train stopped with the cow-catcher of the great locomotive almost in
