No Such Armor Plate as That of Carnegie and the Bethlehem Works Is Now Made Anywhere.

CRUCIAL TESTS OF YESTERDAY.

Heavy Projectiles, Propelled by Mammoth Charges of Powder, Have Very Little Effect

ON NICKEL-STEEL FROM HOMESTEAD.

Rolled Plates Declared Destined to Supersede All Forged Metal.

FROM A STAFF CORRESPONDENT.

WASHINGTON, Nov. 14.-The second of the series of comparative tests of armor plate made by Carnegie, Phipps & Co. and the Bethlehem Iron Company was made to-day at Indian Head, the site of the navy proving grounds, about 30 miles below Washington on the Potoman. The trial to-day was the most marvelous exhibition of the kind, and the results were the most gratifying. It indicated to those present that the rolled plates of the Carnegies are destined to excel all forged armor. Again, the superiority of the nickel steel over that of the ali-steel plate was demonstrated.

To comprehend this most fully, a com-

rison of the tests made to-day and those of October 31 is necessary, and, to more fully appreciate this fact, it is but well to state that if anyone of the shots fire to-day at nickel-steel plates had been fired at an all-steel plate the results would have been disastrous. The plates selected for to-day's trial were a high-earbon nickel-steel, Carnegie, a low carbon nickel-steel, Carnegie; the latter being treated by the Harvey method of surface carbonization; and one high-carbon nickel-steel, of the Bethlehem Iron Company, which was also treated by the Earvey process of superficial carboniza-

A Most Surprising Occurrence. With the latter plate a most surprising

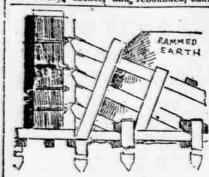

smashed on its face, with its point about 51/2 inches from the face of the plate. This was the last shot from the six-inch gun, which was then removed from the platform and the eight-inch gun was mounted in its stead. When the plates faced the eight-inch gun they were all in good condition, and gave promise of making a good showing against the heavier projectiles. The high-carbon nickel-steel, untreated, was weakened by its four shotholes and by the cracks in its lower portion. The low-carbon nickel-steel Harveyized was weakened only by the four shotholes, and the high-carbon nickel-steel Harveyized the high-carbon neckel-steel Harveyized was practically as strong as ever on the right hand side, which had smashed the projectiles, while it was weakened on the left side by the projectiles which had penetrated.

Results of the Final Tests

Results of the Final Tests.

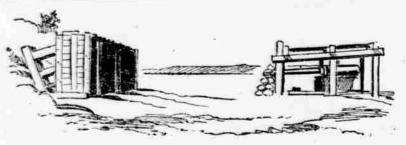

The first eight-inch shot was at the center of the high-carbon untreated plate from Carnegie, Phipps & Co. The projectile, which was of the Carpenter make, penetrated 9% inches, and rebounded, greatly shortened. Cracks extended from the center hole to the upper and lower edges, through the upper right-hand shot-hole and the lower left-hand hole.

The next shot, also a Carpenter projectile, was fired at the center of the low-carbon Harveyized nickel-steel. It penetrated 15% inches, and rebounded, badly

to both the upper and the lower left-hand holes; those to the two left-hand holes extended to the edges of the plate.

The last shot was fired at the center of the high-carbon Harveyized Bethlehem

POSITION OF THE PLATES AND GUY.

the two shots fired from the 6-inch gun, and the shot in the center from the 8-inch gun; while the two shots on the right-hand side from the 6-inch gun penetrate? only to the depth of 5 and 514 inches, respectively. This would indicate a lack of uniformity in the temper, or the possibility of a defect in either of the shells fired.

The tests to-day have been pronounced on all sides to be most wonderful, and are proof of the great progress made in the making of armor in the United States. The guns used were the same as at the test of October 31, a forty-caliber, six-inch gun, and a thirty-five caliber, 8-inch gun. The six-inch projectiles were also the same as those used before, being made by Holtzer, in France.

One of the eight-isch projectiles, was of the Firth-Firminy make, the same as used in the first trial, but as no more of this make were on hand, the other two were Carpenter projectiles, made by the Carpen-ter Steel Company, of Reading, Pa. Fonr six-inch projectiles were fired at each plate, one at each corner, and then one eight-inch projectile at the center of the plate. The six-inch projectile; were weighted to 100 ounds. The powder charge was 42.4 pounds of Dupont brown prismatic powder, giving a striking velocity of 2,075 feet per

Size and Weight of the Projectiles. The Firminy eight-inch projectile weighed 210 pounds, and was fired with 74% pounds of powder giving a striking velocity of 1,750 feet per second. The Carpenter eight inch projectiles weighed 250 pounds, and to equalize the striking energy, the powder

charge was reduced to 721/2 pounds, reduc-ing the velocity to 1,700 feet. The first shot was fired at the upper left-hand corner of the high-carbon nickel-steel hand corner of the high-carbon nickel-steel plate, not Harveyized, from Carnegie, Phipps & Co. The point of impact was two feet from the left-hand edge, and two feet from the top. The projectile rebounded intact. The penetration was 12½ inches. A few small radial cracks were developed in the burr around the shot hole. The wood backing could be seen through the shot hole. The sercend shot was at the corresponding

The second shot was at the corresponding corner of the Harveyized low carbon nickelsteel plate from Carnegie, Phipps & Co. The projectile, apparently uninjured, remained in the plate, with its base projecting beyond the face, and its point 14% inches deep in the plate and backing. Short radial

cracks appeared in the burr. Shot No. 3 was at the corresponding corner of the high carbon nickel-steel Harvey-ized plate from the Bethlehem Iron Works. It rebounded hadly broken, leaving a hole 12 inches deep. Small pieces of the burr were broken off

A Badly Broken Tp Projectile.

Shot No. 4 was at the upper right hand corner of high carbon Carnegie plate. It penetrated 10% inches, and rebounded broker up. Short radial cracks appeared

in the bur.

The fifth shot was at the upper right hand corner of the Harveyized low-earbon Carnegie plate. The shot was almost a duplicate of the first one fired at this plate, the penetration being 14% inches, and the projectile remaining in the place intact.

The sixth shot was at the upper right

hard corner of the high carbon Harvevized plate from Bethlehem. The projectile was virtually smashed to small fragments on the face of the plates. The point was left sticking in the hole with . apparent penetra-

The seventh shot was at the lower left hand corner of the high-carbon Carnegie plate. The projectile penetrated 12 inches, and rebounded broken, leaving the wood visible through the hole. A crack, apparently through to the backing, extended from the hole to the bottom of the plate. Shot No. 8 was at the lower left-hand corner of the low-carbon Harveyized Car-negic plate. The projectile penetrated 93/ inches and rebounded, shortened two inches. The ninth shot was at the lower left-hand orner of the high-carbon Harveyized Bethlubent plate. The penetration was 12% inches. The projectile rebounded intact, and left eight hair-line cracks about the

Another One Not Quite the Best.

The tenth shot was at the lower right-hand corner of the high-carbon Carnegie plate. The penetration was 1136 inches, and the projectile rebounded intact. A deep crack extended from the shot-hole through the lower left-hand hole to the left edge of the plate.
The sleventh shot was at the lower right-

hand corner of the low-carbon Harveyized Carnegie plate. The penetration was 201/ inches, the projectile remaining intact, with its bare three inches from the face of

No. 12 cas at the lower right-hand evener of the algebrarion Harveyized Beth-leheat plate. The projectile was again many people it has cured.

How the Plates Were Backed Up.

proken. Cracks extended from the center

plate. A Firmini projectile was used. It penetrated 1234 inches and rebounded un-broken. The plate was cracked through the upper and left-hand holes to the edge. A member of the board, in speaking of the experiments, said that any one of the

and unlooked for result occurred, it being shots would have gone through the stee deeply penetrated on the left-hand side by the two shots fired from the 6-inch gun, the two shots fired from the 6-inch gun,
