

Agricultural.

Work for June.

We have now the first summer month, and with a very few exceptions, the Spring has passed by without affording any of those delightful days which, in your youth, used to be so congenial to our feelings, and make our young blood and mind run riot in the ecstasy of enjoyment. Nor is this all that is calculated to mark the season just past as one of extraordinary character. March, true to her nature, was as boisterous as of yore; but April, celebrated in song as the month of showers, proved as dry and crusty as an old bachelor, and May, once so prodigal in her moist favors, was as churlish as her predecessor. So that between winds, droughts, frosts and ice, the farmers and planters have had but an indifferent chance to get on with their work. But of this none should complain. It has been so ordained by an all-wise and inscrutable Providence, and it behooves every one who believes in his mercy to yield not only without a murmur, but to receive it as a dispensation for which he should offer up his aspirations in a spirit of thankfulness. If we have had a cold and cheerless spring—if our field operations have been retarded—if our pastures have suffered for want of the springing influence of genial rains—if our grain fields have been stunted their growth—if our corn plants have taken on the in salubrious qualities, we have cause to be thankful that while our kindred in our sister land were suffering with the scourge of famine, and its concomitant distress, we, through the paternal care of Him who tempers the wind to the shorn lamb, have been blessed with abundance, & enabled as remunerating prices to relieve their wants and stay the currents of hunger and pestilence.

Passing from these thoughts, we would, before we open our budget of monthly hints, state that we have paid strict attention to the news brought by every arrival from England, and Europe generally; and after thoroughly reflecting upon it, are confirmed in the opinion we have before repeatedly expressed that, for several years to come, grain and provisions will bear such an appreciated value, as to liberally reward those who produce them in this country. In view of this pleasing prospect, we enjoin it upon all, to proceed on with their work with a will, as the sailor says; for they may confide in the hope, that all their surplus products will find ready markets and good prices. Such has been the universality of short crops in Europe, that it will take some years to bring up leeway, and render the granaries competent to supply anything like the demands of population. And we would impress this fact upon our agricultural friends, that, before an equilibrium of supply and demand shall have been brought about, the intrinsic value of corn and cereal, are food for man and beast, will have taken such hold upon the British judgment, as to make them so necessary to their wants that they will not be able to dispense with them.

With these preliminary remarks, we will pass to the details of work.

ON THE FARM.

Wheat.—Judging by the long continued drought in this part of the country, as well as from the account which have reached us from various other parts, and by the almost interrupted continuance of cold weather, we have arrived at the conclusion, that wheat harvest will be some weeks later this year than usual. But as we believe it to be true economy of time, as well as of money, always to be ahead of one's work, we would here advise all, to take time by the forelock, and prepare every thing in the shape of implements, and in the way of force, so as to be in a condition to commence their harvest so soon as the grain may be ready for the reapers. And as from all we can hear the crop will be a short one, and wheat when gathered, will be scanty, and command a pretty round price, our advice is, that all possible pains should be taken to cut it at the right time, and stack it away, so as to ensure it against the ill effects of weather. The proper time to cut, is when the stem, just below the head, becomes dry, and the source of nutritive supply from the roots are thereby cut off. By waiting until the entire stem is dry, great losses are sustained from scattering, while on the other hand, no advantage is to be derived to the kernels. That this is the case, is so obvious, that we need scarcely illustrate it by argument, and will content ourselves by remarking, that when the extremity of the stem becomes arid, that the circulation from below is arrested in its course, and the process of nutrition cannot be carried on, as at that point, the conduit is literally cut off. It is worthy of an observation, that wheat when cut before it becomes dead ripe, yields a heavier grain and whiter and more productive flour than when harvested at a later period. What we mean by more-productive flour, is this, that it will take more water, and consequently, make more bread, for a pound of flour, and hence, is better for the baker. By cutting wheat at the period we have named, the straw is infinitely better adapted to the purpose of feeding much of its nutritive properties being retained, which, when cut at a later period, would be lost by evaporation.

We would reiterate our advice, that all possible care be taken to protect the grain and straw, after it is down, from the influence of the weather, as we know from experience, that neglect at this period is calculated to impair the slightly appearance, as well as market value of the grain. In stacking, let the utmost care be taken to exclude the possibility of injury from the rains, and to ensure this, each stack should be capped, so as to turn the rain. And we would here remark, that, while every operation of the harvest is going on, the master's presence is indispensably necessary—that, though he may not labor himself, his presence will tend to make his hands do their work in the way that it should be done. The best of hands, if not closely superintended by those whose interest is at stake, will, without intending it, slight their work, and inflict injuries without designing them. Unfortunately, it is in the nature of most men to act thus, and although we would not punish a natural fault, we certainly would not act as to ensure against it. Bear in mind, that he who encounters the toil and expense necessary to make a crop, rests under a high moral obligation to preserve it from going to waste.

Corn.—As there is the most flattering prospect ahead to justify the belief that corn will continue to command a high price, every corn-planter should feel it a moral duty to have his fields carefully tended. No matter how well the ground may have been manured and prepared for the crop, if weeds and grass be permitted to surround the plants to divide with them the nutriment and salts of the earth and air, a stunted growth and diminished

yield will inevitably result; whereas, in all well manured or naturally fertile soils, if the soil be kept stirred and open to atmospheric influences, and the plants be kept clear from intruders, the season must, indeed, be extremely adverse, if the product be not a liberal one, for of all the grain family there is none more generous in its return for labor bestowed upon it.

It is perhaps too early to form any opinion how the season may operate upon this crop: thus far, however, it has proved unpropitious. With but a few days of partial rains, April and May were months of excessive drought, and the young corn suffered greatly for want of moisture; but we sincerely hope that no one on account of the dry weather suffered it to go unworked. A too common opinion prevails—that if corn be worked in dry weather it will fly, as the phrase is. Our opinion is, that by lacerating and cutting up the roots by too deep plowing, such injury may result either in seasons of rain or drought; but we do not believe that any such result would ensue if the cultivator were used instead of the plow. By stirring the earth with the former implement you prepare it to attract and appropriate to itself the dew of the night to a much greater extent than it would if unmoved; and, therefore, instead of properly stirring the earth tending to fire the corn, it would act as preventive.

Full Potatoes.—The earlier these are planted the better. For a safe manner of planting them we refer to our last month's remarks upon this subject.

Planted Warts, Sugar Beet, Carrot, and Parsnips.—If these crops have not already been thinned out, they should be without further delay, and kept clear during the season until they are laid by; the time for which is when the leaves are sufficiently large to shade the ground and keep down all intruders. He that desires to make large crops of either must keep the ground open and clear.

Ruta Baga.—If you desire to cultivate a crop of this excellent root, you should immediately plow the land you intend for it. Plow it as deep as you can drive your plow, then harrow it, and after the grass starts, say in about two weeks, cart on and spread your manure and plow it some three or four inches deep, harrow so as to reduce the soil to a fine tilth then roll. This done, lay off your drills 2 feet apart and 2 inches deep, then drill in your seed thinly. If you have a drill barrow use it; if not, use a bottle. Cover with a rake and press the earth with the back of that implement, so as to bring the soil immediately in contact with the seed, and thus promote early germination.

As soon as you have got your seed in, sow over the rows equal parts of Ashes and Lime, at the rate of ten bushels to the acre.

Manure.—Such manures as are used for the common turnips suit this variety. A mixture of corn manure partially rotted—stable manure, or barn yard manure, in the same condition, mixed with one-eighth its quantity of ashes and about 20 bushels of bone manure would make a most excellent compost, and if properly applied in a good warm soil, would not fail to yield an abundant crop—and we will here remark, that for feeding to sheep, and stock generally, it is one of the most valuable roots grown, and that under favorable circumstances of soil, season, manure, preparation of ground and culture, it will yield as heavy a crop as any other.

Quantity of manure per acre.—20 double horse cart loads.

Quantity of seed per acre.—Where care is taken in the drilling in the seed, 1 lb. per acre will prove sufficient—if put in without care in its distribution, it may require 1 1/2 lb.

Preparation of the Seed.—Soak it a day in fish oil—then drain off the oil thoroughly, put the seed in a large basin or piggins, then mix three parts plaster with one part flour of sulphur well together, stir this mixture over the seed and mix the whole until the seed are sufficiently covered with it to separate and prepare them for sowing.

After Culture.—So soon as the plants come up, let a careful hand go along the rows, mop in hand, and sprinkle fish oil of any kind over them. He should be followed by another with a mixture of equal portions of soil and ashes, which must be sown over the plants. This will serve not only to protect them from the ravages of the fly, but will act as a manure and encourage their growth, and soon place them beyond the period when they delight to feed them on.

When the plants are about 2 inches high, and beyond the depredations of the fly, set a careful hand in to weed and thin them out. The plants should stand from 6 to 8 inches apart in the rows.

In about a week after this operation shall have been performed, put a small sized cultivator in between the rows, going up and down lopping as it goes and returns. The Cultivator must be followed by hoeing, to clean out the weeds between the plants, who in giving them a thorough cleansing, must be careful not to hill up the bulbs, but to maintain a level surface.

Two similar workings, at intervals of 10 days apart will be all the working they require, unless the season should prove particularly productive of weeds and grass. As to the necessity of an additional working the cultivator must be the judge—he must have these facts in mind, that if he desires success the plants must be kept clean, and the earth open to the influence of the atmosphere, and that he need not fear to have them worked in dry weather. If plowed at the rate of a bushel per acre were sown over them at the time of the second working, it would be productive of the best effects.

Upon one occasion we sowed 6 bushels of effuse fish salt over an acre of Ruta Baga, and thought we derived great benefit from its application. The stench of the fish appeared to us to repel the assaults of the fly, whilst the salt itself preserved the earth comparatively moist by its attractive and condensing powers, and the oleaginous matter it had imbibed from the fish encouraged a rapid growth in the plants through its powers of nutrition.

As Corn is sure to command a high price, it should be an object with every agriculturist to grow roots to feed to his stock, and as this is the time to sow Ruta Baga, we most earnestly recommend its culture to all.

Clover Hay.—If owing to backwardness of the season you have been prevented in cutting your clover, and have that still to do, we would advise you to cure it by cooking it so soon as it becomes wilted. By curing it in cocks you prevent loss from the falling off of the leaves, and retain that delightful fragrance which is so acceptable to stock. In stacking it away sprinkle on every ton of it a peck of salt. The salt will prevent its fringing and becoming mouldy, besides it will enable you to stack it away much earlier than if it be not salted.

FOR THE CURE OF DEAFNESS, pain, and the discharge of matter from the ears. Also all those disagreeable sounds, like the buzzing of insects, filling of water, hissing of steam, &c., which are symptoms of approaching deafness, and also generally attendant with the disease. Many persons who have been deaf for ten, fifteen, and even twenty years, and were obliged to use ear trumpets, have, after using one or two bottles, thrown aside their trumpets, being made perfectly well. Physicians and Surgeons highly recommend it.

The very great number of happy results that have followed the use of SCARPA'S ACOUSTIC OIL, have been truly astonishing. And what is wonderful, some who were deaf from birth, have been so much improved as to bear common conversation very readily.

It would be the height of presumption to warrant a cure in all cases, but in some cases out of ten of recent date, there is a certainty that the result will be most happy and satisfactory to the patient. The application of the oil produces no pain, but on the contrary is agreeable and pleasant sensation. The recipe for this medicine has been obtained from an Artist of great reputation, who has found that deafness, in nineteen cases out of twenty, was produced from a want of action in the nerve of hearing, or a dryness in the ear; his object therefore was to find something which would create a healthy condition in those parts. After a long series of experiments his efforts were at last crowned with success, in the discovery of this preparation, which has received the name of SCARPA'S COMPOUND ACOUSTIC OIL. A long list of certificates might be given, but such is the confidence in the medicine, and so high has been its reputation, that but one of them will be at present published.

Most Extraordinary Cure!—A lady of Smithfield, Brad. Co., Pa., and now about thirty years of age, had been gradually getting deaf for more than 40 years, so that it was next to impossible to make her bear conversation in the loudest tone of voice. Last winter she was induced to try "Scarpa's Oil for Deafness." It was only necessary to add that she used two bottles, and in perfect relief to the deafness. The cure was effected in regard to the case may be obtained at the store of Dr. Jayne, No. 8, South Third Street, Philadelphia.

For sale by A. S. CHAMBERLIN, Towanda, Pa.; only agent for Bradford County.

Physicians and Surgeons highly recommend it.

The very great number of happy results that have followed the use of SCARPA'S ACOUSTIC OIL, have been truly astonishing. And what is wonderful, some who were deaf from birth, have been so much improved as to bear common conversation very readily.

It would be the height of presumption to warrant a cure in all cases, but in some cases out of ten of recent date, there is a certainty that the result will be most happy and satisfactory to the patient. The application of the oil produces no pain, but on the contrary is agreeable and pleasant sensation. The recipe for this medicine has been obtained from an Artist of great reputation, who has found that deafness, in nineteen cases out of twenty, was produced from a want of action in the nerve of hearing, or a dryness in the ear; his object therefore was to find something which would create a healthy condition in those parts. After a long series of experiments his efforts were at last crowned with success, in the discovery of this preparation, which has received the name of SCARPA'S COMPOUND ACOUSTIC OIL. A long list of certificates might be given, but such is the confidence in the medicine, and so high has been its reputation, that but one of them will be at present published.

Most Extraordinary Cure!—A lady of Smithfield, Brad. Co., Pa., and now about thirty years of age, had been gradually getting deaf for more than 40 years, so that it was next to impossible to make her bear conversation in the loudest tone of voice. Last winter she was induced to try "Scarpa's Oil for Deafness." It was only necessary to add that she used two bottles, and in perfect relief to the deafness. The cure was effected in regard to the case may be obtained at the store of Dr. Jayne, No. 8, South Third Street, Philadelphia.

For sale by A. S. CHAMBERLIN, Towanda, Pa.; only agent for Bradford County.

Advertisement for Dr. Jackson's Compound Acoustic Oil.

FOR THE CURE OF DEAFNESS, pain, and the discharge of matter from the ears. Also all those disagreeable sounds, like the buzzing of insects, filling of water, hissing of steam, &c., which are symptoms of approaching deafness, and also generally attendant with the disease. Many persons who have been deaf for ten, fifteen, and even twenty years, and were obliged to use ear trumpets, have, after using one or two bottles, thrown aside their trumpets, being made perfectly well. Physicians and Surgeons highly recommend it.
