

DEPTHS OF MANURES.
The subject of the day is manure. Dr. Underhill—I am prepared in some measure to give my ideas of the fertilizing elements of manure when placed in the soil, and of the peculiar depths at which they should be placed, according to the various soils. We are not yet fully able to demonstrate all this, but let me premise by the remark, that probably, near one hundred millions of dollars worth of manures are annually applied to the soil of the United States; and that by putting them on too near the surface—we lose one half by escape into the atmosphere, in the course of our long hot summer. One important object is, then, to save as much as possible of this amount, by a judicious disposition of them. It may be stated safely, that the third of all expense in farming is the manuring of our lands. The question under consideration, do the fertilizing elements of manure descend? Do they always rise? When the rain falls and dissolves them, they descend to a certain extent, but when the sun shines again they ascend. I have managed my farm on this theory, and I have placed my manures deep in the soil. The proper depth depends on the kind of soil—if we put manure on the surface of sandy land, like much of that of Long Island, it is soon lost under the strong solar heat. In such soils on my farm I put it deep, and in a drought I find the excellent. I do not put it so deep in stiff clay soil, nor in a cold soil. When the manure is deep, the first growth of plants is slow, but soon appear the vigorous influence of the manure below. It has been observed a long time that there is a peculiar vigor in the vegetation in grave yards—and it has also been observed that in such yards when old, no interments having been made in a long time, they become sterile. And it has been noticed that where sand has been carried upon high valleys, that land soon becomes fertile—the fertilizing elements ascend. Place a thin covering of straw over poor land, and the places covered are found soon to become rich. The covering arrests the ascending elements of fertilizing, and confines them to the surface of the soil. In North Carolina it was remarked that when the soil was covered by leaves of the pine tree, it was rapidly enriched. So a coat of clover arrests the flight of the fertile elements and enriches land. All that is fertilizing in manure is soluble or gaseous. What would be the thickness of soil in primitive forests, if fertility should never ascend? Yet we find it on the levels where it has never been washed away—but about eighteen inches! The elements do not ascend so rapidly in clay soils as in porous sandy lands.

I covered a sandy field with a coat of clay, and found great benefit to the soil by it. For the purpose of potting manures out deep, it is necessary that we should plow deep, the justly celebrated B. I. strongly recommended it. The salts &c., in solution in the soil, ascend by capillary attraction to the surface. A fall of snow late in the spring has been remarked to cause fertility—grasses especially show this power. I covered my orchard with clover, and it enriches the ground, and I find more vegetable mould than there was before. Our clear sky and great solar heat cause a great loss in the fertility of our soils. In a cool, moist climate like that of England, the results are not the same—a top dressing of manure is good in England, but almost worthless under our sun. Long Island farmers should put the manures deep in their porous sandy soils. In what is called a cool season here, we always raise the best vegetables. Not only do the fertile elements rise, but caloric rises also. I have found ice half an inch on the ground in my orchard, and yet the apples on the trees entirely untouched by frost. This is due to the rising of caloric to the body and limbs of the trees during the night. **Vegetation Vanishes.**—Manures both ascend and descend. By which process is the soil greatest? That must depend on the nature of the soil. Loose porous land admits water containing in solution the elements of manure, to descend readily to the bottom, and then find its way to the valleys through the joints. Rich earth absorbs the gases of manures and water too, for the use of vegetation—and the richer the earth the less of the manure goes down. One cubic inch of water will absorb four hundred and seventy-five cubic inches of some gases. It is certain that long drought lessens the manure in our land, but it is not so certain that putting the manure deep will prevent this. Sir Humphrey Davy's experiments of drying soils perfectly, and then marking their power of attracting and absorbing moisture proved that the richest soils attract and absorb the most. The elements which descend in porous, ascend in heavy, but rich soils retain them. Dr. Underhill—place rich muck deep in my sandy soil, planted grape vines over it, and seven years afterwards, on examination, I could not find any signs of the muck, below it where I put it, or any where else—it must have ascended!

FEED FOR OXEN.
Prof. Maynard on feeding my working horses and oxen with heavy pudding mixed with cut corn stalks, swelled by hot water (of course before fed). After a few days they will eat it well, and my oxen improve rapidly, even while working hard. I use a quart of F. L. Mow's large lumps to cook the meal. For swelling the cut corn stalks, the hot water must contain some salt. Fresh corn only be heated to 212 degrees—but with salt added, it is capable of receiving a much higher degree of heat. It is a good rule to fill of cut corn stalks put in three gallons of boiling water containing one quart of salt, cover the hoghead with a blanket, and let them sweat all night. When cold, take them as dry as they will drip; then mix them with heavy pudding, and any animal of good fair common sense will eat it.

Mr. Bancroft's Opinion of English Agriculture.—At the dinner of the Royal Agricultural Society at Northampton, on the 23d ult., Mr. Bancroft, the American Ambassador, under the health of "The Foreign Minister" being given, made the following graceful speech. He said he could hardly find words to express his gratitude for the kind manner in which his country had been alluded to. Although the Minister of a foreign country, he was not although a stranger in that meeting, for nature had established the bonds of union between the farmers of every nation on the face of the earth. The same sun shone on them all; the same seasons as they returned furnished the seed time, and ripened the harvest. The celestial influence to which he must look for a blessing on the exertions might well be the blessing of the husbandman with that spirit of brotherhood which had made the tiller of the soil, wherever he may be, a brother of the tiller of the soil. The celestial influence to which he must look for a blessing on the exertions might well be the blessing of the husbandman with that spirit of brotherhood which had made the tiller of the soil, wherever he may be, a brother of the tiller of the soil.

CHALLENGE CHALLENGE!
We have observed very patiently for a year past the various attempts by some of our countrymen to force a reputation which their professional skill alone could not give them. And we would continue, we should observe, under the same patient eye, this species of challenge, if it were not for the fact, that this species of challenge may divert the public eye from a more judicious and profitable mode of the multitude of professions of the Democratic art.

CHALLENGE CHALLENGE!
We would see men seek an honorable publicity, and thereby win for each golden opinions; but we do not desire that any man should be known for his professional skill, who is not known for his moral worth. It is to us a high honor to have an opinion given by a man of high standing in his profession, who is not known for his moral worth. It is to us a high honor to have an opinion given by a man of high standing in his profession, who is not known for his moral worth.

NEW ESTABLISHMENT
L. M. NYE & CO. would respectfully inform the citizens of Towanda, and the public generally, that they have on hand all kinds of CABINET FURNITURE, of the best material, and workmanship that cannot be surpassed, in addition to the usual assortment in country shops, we will keep on hand and make to order SOFAS, of various and most approved patterns; Sofa Rocking Chairs, upholstered in superior style, and for ease and durability cannot be surpassed even in our large cities. Also, the half French, the hoganey Chair, beautifully upholstered, with curled hair, which never loses its elasticity, and finished with the best hair matting. We flatter ourselves that having had much experience in the business, we shall be able to satisfy all the requirements of the public, both as to quality and price, and by sitting in our store, we have hopes to merit and receive the patronage of a liberal community.

CABINET FURNITURE
MAY BE HAD AT OUR SHOP MUCH LOWER THAN IT HAS EVER BEEN SOLD IN TOWANDA. Goods very cheap, and what are lowered, and that is the reason we can afford all for to do it. All kinds of produce will be received in payment. Also, LUMBER of all kinds, Sept. 1. L. M. NYE & CO. Towanda, September 1, 1847.

WILL be kept on hand a large assortment, and made to order on shorter notice and for less money than can be produced at any other establishment in the land. Those who are unable to satisfy the public, procuring that article will find the necessity of a good horse and mill may be had in attendance when desired. September 1, 1847. L. M. NYE & CO.
