

Farmer's Department.

Lime for Fowls.

All domestic fowls, as well as other animals, require more or less lime. It is the chief constituent of their bones, and is probably useful in many cases, in small quantities as a condiment.

But in winter, when fowls have less access to the ground, or when they are confined in small enclosures, they have less opportunity to select the mineral substances which they require.

Mr. Editor:—As a farmer, I am very glad you have determined to devote a portion of your paper to agricultural articles. The farming interest are entirely too much neglected by the Country press generally; and it has often been a matter of surprise to me.

In your introduction of this subject, you very correctly condemned the habit which prevails among agricultural writers, of so interlarding with technicalities, their productions, that the common reader cannot understand them.

We see no objection to giving lime to fowls in solution, provided they have pure water always within their reach, but there is nothing to show that this form of giving lime has any advantages over the mode first described above.

Work for the Month.

We are now in the midst of winter—but winter has its charms and duties. This is generally regarded by other occupations as the most leisure month in the whole year for the farmer.

If you expect to carry your sheep through the winter, so as to have them come out safely and in good condition in the spring, they must be kept constantly comfortable. They must be fed often and regularly—have free access to good water—be sheltered from the cold winds and storms; and, when kept in large numbers, the weak and strong should be separated into different flocks.

After the ground is plowed and well harrowed, we furrow one way, drop our seed in drills twelve inches apart, then throw a light furrow over it from each side; when up, we scatter equal quantities of ashes and plaster over, plow twice and leave them. In the fall when we take up, we take a light furrow from each side of the drill, then run the plow through the centre, and have hands to follow and pick up; when the whole piece is gone over in this way, we harrow it both ways. This levels the ground and leaves it in a good condition, and brings up most of the potatoes that were not brought out in the plowing.

Look to your fruit trees—see that the rabbits and mice are not barking them. Remove all grass and litter that will afford material for their nests. Coarse manure or litter of any kind should never be put around fruit trees in the fall. If there be snow on the ground tramp it down solid around the body of the trees.

The long winter evenings afford leisure for study and investigation in relation to your calling. Provide yourself with agricultural books and papers, such as treat upon the plants and animals you are raising. Read and reflect—and don't forget to get up a rousing big club of subscribers for the "Bradford Reporter," which will contain a choice selection of Agricultural reading, of itself worth more than the subscription; to say nothing of tales, essays, anecdotes, poetry, news, politics, &c.

Hoof Bound.

The following are the directions of Dr. Dadd for this disease, and we regard them as the best we have seen on this interesting subject to every farmer, few of whom are acquainted with this important knowledge.

In all cases we must endeavor to give the frog a bearing on the ground; and in order to do this the shoe ought to be removed. A dry, brittle and contracted hoof may be improved by repeated poulticing with soft soap and rye meal, applied cold. So soon as the hoof softens, let it be dressed, night and morning, with turpentine, linseed oil and powdered charcoal, equal

parts. Yet, after all, a run of grass in a soft pasture, the animal having nothing more than tips on his feet, is the best treatment. A very popular notion exists that cow manure has a wonderful effect on a contracted hoof; but it is the candid opinion of the author, and no doubt the reader will coincide, that filth and dirt of every kind are unfavorable to healthy action. Such remedy, aside from its objection on the score of decency, savors too much of by-gone days, when live cels were sent on an errand down horse's throats to unravel their intestines. If any benefit belongs to such objectionable application, it is due to the property it possesses of retaining moisture; therefore cold poultices and water are far superior. Clay and moist earth placed in the stall for the horse to stand upon, are far inferior to a stuffing of wet oakum, which can be removed at pleasure. In order to keep it in contact with the sole, we have only to insinuate two strips of wood between the sole and shoe; one running lengthwise and the other crosswise of the foot. It affords considerable pressure to the foot, its cooling and cleanly, and is far superior to the above articles.

[For the Bradford Reporter.]

Alcohol.

AYER'S PILLS. AND CHERRY PECTORAL.—The following remedies are the best that can be given for the most distressing cough, and the most distressing asthma, which medical science can afford. AYER'S CATHARTIC PILLS have been prepared with the utmost skill which the medical profession of this age possesses, and their effects show they have virtues which no other combination of medicines hitherto known. Other preparations do more or less good; but this cures such dangerous complaints, so quick and so surely, as to prove an antidote to the most violent and distressing cough, and to the most distressing asthma, which medical science can afford.

Give them to some patient who has been prostrated with illious complaint; and see his bent-up, tottering form straighten up with strength again; see his languid appetite restore; see his clammy features blossom into health. Give them to some sufferer whose foul blood has burst out in scrofula, and his skin is covered with sores; or who has the scales fall from his body, and he is left a cripple. Give them to some one who has been drenched inside and out with every evil potion which ingenuity could suggest.
