Take two plots of heavy soil side by side, and let one lie unmoved till spring, while the other is deeply plowed in autumn, and the result will be very visible in the spring crop .-But the manner of plowing is important secure the greatest possible advantage, a single furrow should be thrown up, and another back furrow directly upon it, so as to produce a high ridge, and another ridge is to be made in the same manner with a deep dead-furrow between the two. The process is to be continued thus through the field, so that when finished, it will present a surface of high ridges and deep dead furrows, succeeding each other, about once in two or two and a half feet. If prepared in this way, the frost will penetrate far downward, loosening and disintegrating the soil below the furrows, while the ridges will crumble down, as they will not hold water, the air will circulate freely through them, decomposing the mineral portions, and conveying in the ammouia and other gases. This operation will be equal to ten or more loads of good manure, upon clay or compact soils.

In the Spring it will only be necessary to run a plow once or twice through the center of each ridge, and then level the whole down with a heavy harrow.

Another advantage in this process, is that when land is thus prepared, it dries out and warms several days earlier in the Spring .-Again, there are some soils that are exhausted upon the winter, these poisonous compounds (usually proto-sulphate of iron or mangnese) will be destroyed, or changed to a harmless

form, during the winter.

The above practice is especially to be recommended in the garden. One of the most successful cultivators of an acre of ground in our acquaintance, digs it up in the fall to the depth of these or few feet making depths of these or few feet making depths of the product of the produ depth of three or four feet, making deep trenches and high ridges, so that the whole acre appears to be covered with high winrows of hay placed closely together.

taken at the holidays.

TERMS. PER QUARTER:

First Class—To include the elementary Englishbranches, and the study of the Latin language. Second Class—To include the more advanced studies of the English branches, with Mathematics, and the study of Latin and French.

We strongly urge every farmer who has not bried this method, to lay out their plans now or experiment in this way, on a larger or smalor experiment in this way, on a larger or smalor scale, during the present season.—Agriculwralist.

Horse-shoeing. How many horses, valuable horses in many respects, are spoiled by having defective fore feet. The general defect in the fore feet is called "pinched" or contracted feet. This makes the animal tender forward, liable to fall when going down hill, and consequently unsafe. When the forward feet of the horse are defective, his usefulness on the road is much impaired; and, in fact, there is no comfort or safety in using such a horse. What causes tender feet? The most com-

mon cause is bad shoeing, with improper care REV. SAMUEL F. COLT, Principal, Professor of Natumon cause is bad shoeing, with improper care of the animal. There are few good horseshoers. Not one blacksmith in fifty knows how to shoe a horse properly. How frequently do boys and apprentices, as soon as they can drive a nail, undertake to set shoes without any knowledge of the anatomy of the horse's feet, or any of that inborn philosophy which teaches a man to look at the reason of the teaches a man to look at the reason of the thing. It is a shame and an outrage upon the rights of horses to have such a state of things.

man in a hundred knows when his horse is well shod. Commonly, a man leads his horse to the blacksmith-shop, lets the work be done, and then goes off with his horse, satisfied, because he has shoes on his feet.

There are two very common faults in shoe-There are two very common lautes in short single lessons, 50c, or for practice \$2.00 No scholar, whose parents or guardians shall reside the short stravel with ease, unless his shoes are long enough for him to set his whole shoes are long enough for him to set his whole loaned by such pupil, his or her parent or guardian.

EXTRACT: feet down on the shoes? A horse suffers as much with short shoes, as a man does with boots of any insufficient length. How can a boots of any insufficient length. How can a horse travel easily all day over our rough roads, with shoes half an inch too short? I do not know how many times I have been pained at oil painting in landscapes, per term. seeing horses with short shoes on. Have the shoe as long as the foot. The longer it is, reasonably, the better support it will give.

The second fault is, shoes are made concave instead of convex. When a horse sets down his foot, if it can, it will spread a little. This arrangement was made to save the animal from pounding a solid foot on the ground. The foot of a horse has layers or springs, as it were, in it; and the shoe should be made accordingly. If the heel of the shoe dishes in, how can the horse's heel spread when he puts his foot down? It can not; but it is bound tighter, so that it cramps the foot and after a while it results in pinched feet

A forward foot shoe should be made with the heel of it slightly convex, to let the heel spread naturally when the horse puts his foot down .- Maine Farmer.

person in the State of New York procured and sowed, last year, thirty-five pounds of this wheat, and the produce was thirty bushelsnearly a bushel to a pound of seed sown. It is an early white wheat, and stools wheat .--The straw is strong-is solid in the upper portion, but in the lower has a pith like the elder. The heads are branched, having one main head, and from it, shoots out from three and four to eight and ten heads. One stalk on a shoot, exhibited at the Ohio State Fair, had on it eight, and another ten heads, besides the main head. It is not likely to lodge, and the whole patch raised last year averaged near six feet high. Its origin is said to be unknown.

ARTIFICIAL FISH .- There was a new feature at the Agricultural Fair, at Cleveland, Ohioa show of fish raised artificially. They are chiefly spotted brook trout, from six months to two years old, and were in a large tank with glass sides, supplied with a running stream of ice water. Doctors Garlich and Arckley, who furnish the exhibition, have quite a "fish raising" about two miles from Cleveland. In the pond are thousands of fish, principally trout, all raised by artificial means.

Condensed Eggs, like solidified milk, are among the novelties of recent device. The volk and white are subjected to evaporation. When thoroughly dried, the mass is reduced to powder, packed in tins, and kept for any length of time. This powder, it is said, may be used for all purposes, just as the fresh egg

THE ELECTRO CHEMICAL BATH, DIRECT & TO-&-FRO ELECTRO MAGNETIC MACHINE.

JAMES HARRIS, ELECTRICIAN, of Towarda, respectfully informs the public that he has lately procured from New York the celebrated Electro-Chemical Bath, which has proven to be one of the most 'important and wonderful discoveries of the age, from its ability to extract minerals from the human system.

Some eight years ago, a physician of Cincinnati discovered the process of extracting minerals from the body, by galvanism: more recently, M. Verges, of New York, an electro-gilder, having suffered from the introduction of poisonous minerals into his system in the prosecution of

poisonous minerals into his system in the prosecution of his art, conceived the idea of removing them by the same his art, conceived the idea of removing them by the same processes, he succeeded in doing so, and quickly recovered. He then applied the same means to others similarly affected, with like results. His success exceeded his most sanguine expectations, for not only did these Baths remove mineral poisons, but cured many diseases, some of which were the result of minerals, and some were not.

More recent experiments have fully continued the singular power of this Bath to draw from the system all minerals that may be lodged therein, to the great detriment of health. Very often persons are afflicted by diseases which are beyond the comprehension of the most skilful physicians, and which are the effect of poisonous minerals accumulating in the system for years, taken in the

physicians, and which are the effect of poisonous mine-rals accumulating in the system for years, taken in the shape of calomel, lead, &c. &c.

The following are some of the diseases cured by these baths: Rheumatism, Paralysis, Palsy, Painter's Cholic, Chronic Ulcers, Glandular Swellings, Scrofula, Cancer, Neuralia in all its forms, Salt Rheum and Humors of all kinds.

Neuralia in all its forms, Salt Rheum and Humors of all kinds.

He has also S. B. Smith's newly invented DIRECT AND TO-AND-FRO ELECTRO MAGNETIC MACHINE, which is a great improvement on the Magnetic machines heretofore in use. With the aid of the Bath and Machine, we have at command all the available medical efficiency of Electricity. The medical power of the Machine is very great, in introducing medicines into the system through the pores of the skin—applying it directly to the parts affected, which gives an increase of medicinal power over that of taking it into the stomach, rendering it particularly efficacious in all local diseases.

I am now prepared to apply these Baths, and also the Machines, at my house in the south part of the borough of Towanda, or I will visit patients at a distance, who are unable by reason of disease to come to this place, at moderate prices.

I am also sole agent for Bradford county, for the above Machines.

JAMES HARRIS.
