### How to Make Good Eutter.

In the Corning Journal we find a letter from the Hon. Andrew Dickinson, of Steuben which contains much valuable information or the process of making butter. Mr. Dickinson is a thorough practical farmer, and his opinions and suggestions are of more than ordinary value. The following is his letter :-

I will endeavor to give the general outlines the essential leading principles without attempt ing to give all the exact details, as it would be a much easier task to teach a man tomake a watch, than how to make the first quality of butter; as it is the most sensitive, it is the most liable to injury, of all entables extracted from the vegetable kingdom. The first important thing for making butter is the cow. Without stopping to give a full description for selecting she must give good rich milk, as first quality of butter cannot be made from poor, pale milk, as pale milk lacks the essential

quality of good butter.

The idea of coloring butter with anything after it is made, is as absurd as would be the painting of rye bread to make it white, with the expectation of changing its flavor. Butter is so sensitive, it partakes of everything that can effect it, that it comes in contact with ; as onions, carrots, parsnips, turnips, fish, or anything else that would make it uppalatable, either in the butter or the milk churning. Not only so, but the butter partakes of everything the cow eats or drinks, and the longer it stands after being made, the more perceptible will the unpalatable things on which she fed make themselves manifest. By this it will be seen that the most important thing for first quality butter, is the food for the cow. Neither from roots of any sort or kind, nor grain of any description, can first quality butter be extracted. It must be from something that imparts! a sweeter and finer flavor, and from nothing, growing in this country that I know, except timothy, white clover, blue grass, red-top and foul meadow, can first quality of butter be made, that will stand the test so as to remain sweet until the winter or spring after it is made and each of these grasses must have been sowed or-seeded down sufficiently long and so cared for as to have a sod thick enough to make it produce a fine solid grass, to make it a perfect dairy pasture, though many other grasses will make good butter for immediate use, but not to keep. The cow, too, must be well wintered, however good she may have been to make good butter, because if poor, her milk will also be poor and white, and of course the butter ditto. Your correspondent says. "If you had seen, as I have done, the farmers wives and daughters with tears in their eyes, when told that the product of their summer's labor, as shown in their butter, was a poor article," &c., &c. For none of these things are the dairy women in the least resposible, and no one else but the dairy man, or provider of the cows food ; yet in this, as in many, very many instances, the wrong persons are held accountable for things over which they have no control. The manfacturing is an essential part of the business, yet the neglect of any of the above mentioned requirements is fatal to a first rate dairy for winter use. The cow must be looked after as soon as

she comes in, and milked sufficiently after to prevent her bag from becoming feverish and caking, as one milking from a feverish cow would spoil a whole churning, and that would spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed, spoil a whole firkin in which it was packed. though it might not be pereceptible for immediate use, and and none but the skilful butter maker would perceive it in the churning of the butter. Such milk froths and foams, and when it does this as well as from other causes, it is always safest to sell it for immediate use, or pack it separately in a firkin to sell for what it will bring. The churn should be as nearly straight up and down as possible, as the dash should stir all the milk every stroke it makes, so that the butter in the churn should all French come at the same time. If the milk is too Drawing. come at the same time. If the milk is too cold, the only safe way to warm it is to place a pail of milk in a large boiler of warm water barries. It is to place a pail of milk in a large boiler of warm water barries at the same time. If the milk is too do per quarter of 11 weeks, in the lastitute, per week, including fuel and barries are time. a pail of milk in a large boiler of warm water to bring it to the exact temperature, which is washing per dozen,. about 55 deg. to 60 deg.,-a few degrees warmer in cold than in warm weather. As soon as the butter has come and gathered, take it immediately from the churn in its warm state, and put in a large wooden bowl, which is the best vessel for the purpose; than put in cold, soft water; then commence pulling the butter over with the ladle in so gentle and careful a a manner as not to affect the grain, for as sure as that is injured at the washing or working, the butter becomes oily and can never be reclaimed. Every particle of milk must be washed out, and then seasoned with the best of Liverpool salt. Set the bowl away until the next day, and when sufficiently cool, work the mass thorughly, but not so as to affect the grain, and on the third day pack it away if it has assumed the right color. Examine it well before packing and be sure there is no milky water runs from it, for as sure as it is packed with the least drop in the butter, you will hear from it the next March or April. The sooner you dispose of unwashed butter the better, as a little milk would not harm it much for immediate use.

If your spring or well water is hard, I should advise saving the ice from river or stream, though the water is hard, as the lime never congeals with the ice. Save rain water, and then with ice you will have soft water sufficiently cool to wash your butter, without which no man or woman can get the milk without injuring the grain, so that the injurious effects of the lime water will not exhibit itself in five or H. A. BURBANK'S BAKERY six months. Soft water is as indispensable to wash butter as fine linen. From all this I do not wish to be understand that washing butter is positively necessary if it be used within a few

A. B. DICKINSON. HORNBY, March 18, 1858.

WEANING CALVES .- The best mode of weaning is to keep the calves in the barn on hay And whether they are permitted to suck the cow three days or three months, they should procure good hay. Calves will readily eat good fine hay when they are two or three | To one door weeks old, but they will not then eat grass enough to keep a grasshopper alive.

We often see young calves tethered out in gardens and on headlands where the richest clover grows-yet they always seem pining for something to eat. And when they have slops given them and all manner of stuffing they look poor and emaciated.

One reason is, the flies pester them exceedingly when out in the open day light, but in a barn properly closed the flies are seldom seen.

A one-armed man is always an offhanded
