CITY AND SUBURBAN. Summer Sours. Physiological research, (says Dr. Hall) has fully established the fact that acids promote the separation of the bile from the food, which is then passed from the system, thus preventing the prevailing disease of summer. All fevers are "bilious," and the bile is in the blood. Whatever is antagonistic to the liver is "bilious," and the acids which they contain, aids in separating the bile from the blood, that is, aids in purifying the blood. Hence the great yearning for green and lettuce, and salads in the early part of the summer. Hence also the yearning for acids, such as lemon-ade, and the like for something sour, for lemon-ade on a hot day. But this being the cause of fevers and biliousness in proportion as we eat more acid, or more sour, and more of them, if we eat them in their natural state, they are not so dangerous. Hence also the yearning for acids, such as lemon-ade, and the like for something sour, for lemon-ade on a hot day. But this being the cause of fevers and biliousness in proportion as we eat more acid, or more sour, and more of them, if we eat them in their natural state, they are not so dangerous.
