TRUE CHIVALRY.

In the cholera-wards of the London Hospital, in a scene of suffering and death suffipital, in a scene of suffering and death sufficient to try the stoutest heart, a lady volunteer hurse has passed her time since the beginning of the epidemic, moving from bed to bed in ceaseless efforts to comfort and relieve. So very youthful and so very fair is this devoted girl, that it is difficult to control a feeling of pain at her presence under such diroumstances. But she offered her help at a time when, from the sudden inroad of cases, anch assistance was uppently reof cases, such assistance was urgently required, and nobly has she followed her selfsought duty. Wherever the need is greatest and the work hardest, there she is to be seen toiling until her limbs refuse to sustain her. And the effect of the fair young creature's presence has been that the nurses have been encouraged by her never failing energy and cheeriness, so that the dread of the disease has been lost in efforts to combat it. This is an instance of devotion which t would be an insult to praise—it need only be recorded.—Lancet.]

Listen, where o'er startled Europe, Roll the dreadful peals of war; Echoes from opposed armies, As of thunder heard afar! Hark, how each disputes the glory; How both sides the victory claim; How the lying wires alternate Flash for each a transient fame!

Let them vault their fatal conquests; Let them boast their thousands slain; Let them count the vidows, orphan, Made for vile Ambition's gain! Shall no other deeds be blazoned, Than fell war's triumphant wrong? Not be shrined in grateful song?

Not amid the din of battle. Proudest victories are won: Feats of daring not less glorious Are by fragile Woman done. Mid the haunts of human suffering. Many a noble fight is fought; Where unhymned by blare of trumpet, Deeds of Chivalry are wrought.

Where by foulest terrors girded, Death the stoutest heart appals ! Fearless, undismayed in spirit,
'Midst the horrors rampant there, Moves with noiseless step a maiden, Gentle, young and passing fair. Like a ray of heavenly mercy,

Lo. where Cholera's fainting victims

Writhe within the Spital walls;

Tender, steadfast, meek and calm, She around each couch af anguish Sheds sweetly Pity's priceless balm. Beaming in a halo round her, Sympathy's divinest grace Lends to all a new born courage, Lights with love that loathsome place. Brave, serene, her self-devotion,

Eager in the fearful strife, Steals from livid death its terrors, Sooths the parting pange of life. Ever where the need is screet, Tend the maiden's efforts still: rail of form, fatigue still conquering With the might of dauntless will. Easy is the soldier's daring. While the hostile thunders roar, And the fateful balls, thick volleyed,

'Mid the crash and cloud of battle. Death but seems a common foe, Whom with level chance we close with, When we render blow for blow. But a grander thing I count it-Higher courage far, I ween— Thus unarmed to beard the tyrant, In his ghastliest aspect seen.
Blazon, then, a deed so noble,
Rather than triumphant wrong;

To True Chivalry all honor!

Like a hissing hailstorm pour.

Shrine we it in grateful song! Chemistry of the Atmosphere A Divine Arranger must have spread out the thin, filmy curtain of the sky, like that thin film of water, the blue soap bubble, which, like the atmosphere, reflects and decomposes the light reflected on its surface. As with light, so also the atmosphere is the conductor of sound. Prof. Cooke says:

"Every one who has dropped a stone into the water of a still lake has noticed the system of waves which, with its ever-increasing circles, spreads in every direction from the stone; but all may not know that when two stones are struck together in the air a similar system of aerial waves spread, in ever-wid-ening spheres, through the atmosphere, and that it is these waves breaking on the tympanum of our ears, like the waves of water on a sand-beach, which produce the sensation which we call sound. Two stones thus struck together give rise to waves of unequal size, following one another at irregular intervals; and such waves produce an unpleasant sensation on our auditory nerves which we call noise. But if, instead of striking together two stones, we set in vibration the string of a planeforte or the reed of an an organpipe, we excite a system of waves, all of equal size, and succeeding one another with perfect regularity, and these breaking on the ear produce by their regular beats what we call a musical note. If the waves follow one another with such rapidity that one hundred and twentyeight break on the tympanum every second, the note has a fixed pitch called in music C natural. If the waves come faster than this, the pitch is higher, and if less rapidly, the pitch is lower. What you are all familiar with as the pitch of musical note depends then, on the rapidity with which the waves of sound strike the ear, and may evidently be measured by the number of waves break-

ing on the tympanum in a second." Science demonstrates that the difference between colors is of precisely the same kind as the difference between tones. Red, yellow, green, blue, violet, &c., are names we give to sensations caused by waves of ether breaking at intervals on the retina, and color corresponds to pitch, and at every step as the whole scale of colors spreads out before us the analogy of light to sound becomes still more evident. And thus wonderful are the forces the atmosphere holds and the varieties of arrangement it displays; it modifies and, diffuses heat, while it holds and dispenses the mysterious and astonishing agencies of electricity, just astonishing agencies of electricity, just as the electrical machine is constantly rubbing together glass and silk, just as we rub a stick of sealing wax or a glass-tube with a warm silk, handkerchief, so the air is always rubbing over the face of the earth with greater or less residity. the face of the earth with greater or less rapidity. Nature seems to be a great electrical machine. As man guards his roof from the destructive action of lighting—dashing to the earth, crashing, rending and burning on its way—by erecting the lightning-rod, whose bristling points quietly drain the clouds or, failing to do this, receive the charge and bear it harmless to the earth, so God has made a harmless conduct in every pointed leaf, every blade of grass, pointed with nature's exquisite workmanship, is three times as effectual as the dark an nour for the nation the charge to escape through the insulating covering to the earth. With a single galvanic cell, composed of a few drops of acid in a silver thimble and a fragment of zinc weighing a grain or two, conversation may readily, though of the cables or through the two formed together at Newfoundland so as to form a loop, and, although in the latter case the spark, twice traversing the breadth of the cables of cable, its effects at the distant end are visible on the galvanomete in a little more than a second after contact is made with the battery.

lic points of the best constructed rod. What, then, must be the agency of a single forest in disarming the forces of the storms of their terrors-while the same Almighty hand has made raindrops and snow-flakes to be conductors, bridges for the lightning in the clouds, alike, it seems, proclaiming the mercy and majesty of the Almighty hand?-Eclectic Review.

Return of a Party of Russian-American Telegraph Explorers.
[From the Alta Californian of Sept. 28]

Major F. L. Pope has lately returned to this city, after an adventurous exploring expedition in the service of the Russian-American Telegraph Company. Accompanied by Mr. Blenkinsop, of Victoria, two Indians and four dogs, he left New Westminster, near the mouth of Frazer River, May 1st, 1866, and in October he reached Lake Tatla, the head of Frazer river, after a journey of 800 miles. Here he spent about four months, the winter being too severe for traveling. It was his duty to travel in a north-west direction and find the Stickeen river, over a country through which no white man had ever passed. The country was covered with a deep, light snow; they had no means of transporting their food, blankets and tools save their dogs and themselves; their stock of provisions was small; there was no game, and it was doubtful whether they would find any Indians who could feed them or would be disposed to do so. What other obstacles might obstruct their way could be surmised but not known.

On the 29th of February, 1866, they left their camp, following the course of a valley in which Lake Tatla lay. The men were provided with snow shoes. and the dogs were hitched to a sledge on which was laden 425 pounds of provisions and other baggage. Soon after starting, they reached the Skeena river, which empties into the ocean about latitude 54 degrees, and they traveled up its valley, which lay in their course. About latitude 57 degrees, where they first saw it, it breaks through the mountain ridge west of the valley, and they knew from its size and position that it must be the Skeena. They arrived at the head of the river, on the 23d of March. Here one of the dogs was killed, because he was too weak to go any further. The other dogs were very weak, and the snow had been so soft that the party could not go more than three or four miles a day. unless they could make better time than that they would be in great danger of perishing. They determined to push on, however, and in a few furlongs after leaving the Skeena, the snow became harder, and better for traveling, and they found they were on a stream running northwest. They followed this down 50 miles, when, about latitude 58 degrees, it suddenly turned to the west. They knew that it must be a tributary of the Stickeen, so they followed it down and satisfied themselves that it was the main river. In May they reached its mouth, where they found the Hudson Bay Company's steamer Otter, which carried them to Victoria, whence Major Pope came to this city. His land journey took him a distance of 1,200 miles, and occupied a year, during the greater part of which time he was

far from any human habitation. He found a valley of three miles wide, bounded on the east by high mountains, extending northwestward from Lake Tatla to the bend of the Stickeen river, and the divides between the Fraser and the Skeens, and between the Skeens and the Stickeen are so low that the traveler would scarcely notice them if the waters did not flow in different directions. This valley is open, and favorable for the construction of a telegraph line, with enough timber for poles. The country, however presents few attractions for the residence of the men who would have charge of the line. Pope's Valley, as we name it, is about 200 miles from the coast, and parallel with it. The telegraph line is now finished to Rocher de Boulleron the Skeenariver, about 50 miles west of Pope's Valley; and it is doubtful. veler would scarcely notice them if the Bouller on the Skeena river, about 50 miles west of Pope's Valley; and it is doubtful, or was at the last accounts, whether the line should thence follow up the Skeena to Pope's Valley, or strike directly northwest to Buck's Bar, on the Stickeen river. Something will probably depend upon the report of the exploring party which ascended the Kwichpake, and were to meet Major Pope on the Stickeen, but have not as yet been heard from. The distance of Rocher de Bouller from the mouth of Fraser river, by the telestickeen, but he was the strike the st the distance of Rocher de Bouller from the mouth of Fraser river, by the tele graphic line, is about 700 miles, so the work has already made much progress. At Buck's Bar, on the Stickeen, 15 miles from the ocean, there are six white miners, who have been there for years, and are doing well. They say that the gold mines are rich and extensive, and that there are required to the sixe. sive, and that there are valuable lod of silver and copper ores in the vicinity Major Pope saw one lump of native copper nearly as large as a quart bow

The Atlantic Cables. The following letter has been received by the Atlantic Telegraph Company from Mr. Latimer Clarke: "VALENTIA Sept. 12, 1866.—My Dear Sir. You have doubtless received through Mr. M'Cur doubtless received through Mr. M'Curley the certificate of the completion of the cable of 1865. I have since been engaged in repeating all the tests of both cables at greater leisure; the results are most satisfactory, and bear ample testimony to the great care and skill which must have been bestowed upon them at every yard and in every stage of their manufacture. The insulation of the 1865 cable is even better than that of the 1866, but this is doubtless attributable to having been longer submerged—time having the well known effect of improvhaving the well known effect of improv having the well known effect or improving the quality of gutta percha. The cable of 1866 has, however, also so greatly improved since it was submerged in July last that it is doubtful which will ultimately prove the better. The perfection of the insulation of these lines is very gratifying, and must certainly appear surinsulation of these lines is very gratifying, and must certainly appear surprising to any who are not aware of the great advances which have of late years been made in every branch of telegraphy. If either of the cables, for example, be disconnected from the earth and charged with electricity, it requires more than an hour for the half of the charge to escape through the insulating covering to the earth. With a single galvanic cell, composed of a few drops of acid in a silver thimble and a fragment of zinc weighing a grain or two, conversation may readily, though slowly, be carried on either through one of the cables or through the two formed

twig is far more efficient than the me- i deflections are not of a dubious character but full and strong, the spot of light traversing freely through a space of twelve or eighteen inches on the scale, and it is manifest that a battery very many times smaller would suffice to produce similar effects. The length of the 1865 cable is 1,896,48 nautical miles, being 38 miles longer than that first completed, but there is no apparent difference in their speed of working. The clerks are rapidly gaining experience and confidence in working, and have in some short and exceptional trials attained a speed of even 17 or 18 words per minute. Judging from the experience afforded by other cables, and from all that it known of the character of the bottom of the Atlantic, there appears every reason to expect that these cables will maintain their electrical perfection through a long series of years.-I am, dear sir, yours faithfully, [Signed] LATI. MER CLARKE.—To George Saward, risq. Aslantic Telegraph Company, London.

THE OLDEST HOUSE IN NEW HAMP SHIRE. - The following is from the Portsmouth (N. H.) Journal: "Theoldest house now standing, built in Ports mouth, is the quaint brick house on the Weeks farm, Greenland. This is no blunder, although it seems like one—for at the time that house was built, Greenland was a part of Portsmouth. We can find no written record of the year of its being built, but a family tradition dates its creation in 1637, by the father of Leonard Weeks. The house was built on the main road—but the straightening of the road half a century ago, throws it on a circular lane several rods on the side. The speckled appearance of the house is made by having black header scattered among the bricks all ove the front. The bricks were burnt in front of the house. The walls of the house are eighteen inches thick. It is of two stories; the lower story is eight and a half feet, the second eight feet. The windows were originally of small diamond glass set in lead. Some of them have been in the house within the last fifty years. The timber used throughout the house and for the roof are all of hard wood. The beams in the cellar are squared, twelve by fourteen inches. The sleepers are of red oak, about ten inches in diameter, with the bark on. There are planks on the inside of the walls, and the plastering is on reft wood nailed to the plank. There are marks of the house being injured by an earth-quake, probably in 1755. If tradition is correct, this is the oldest house in New England, being two hundred and twentyeight years old.

"This house was evidently built as a sort of garrison, with a view of safety from being burnt by Indians."

FALL PLANTING OF FRUIT TREES .-In planting of fall fruit trees, the pear, apple and cherry invariably do better fall planted than when deferred till spring, north of Philadelphia. The peach, plum and apricot should not be planted till spring, if not done before heavy frost. All fruit trees when set out should be vigorously shortened in. Trees should not be planted deep—no deeper than they grew before removal. It is better to draw a mound of soil about them for the winter, to be removed early in the spring; it preserves from frost and throws off superabundant moisture. Dwarf pears must be set below the quince stock—and in se-lecting these, choose those that are budwhere a long-legged quince stock has to be buried so deep, the tree makes but a poor growth for some seasons afterwards, and is in other respects injured. In severe crimates. cherries of very luxuriant growth are liable to be winter killed. To obviate this, the weaker growing kinds, as the Duke and Morello, and the Mahabled, are used for stocks to graft them on.
This checks their vigor, and renders
them harder. It, however, always keeps
them dwarf—and superior sized fruit is
not so probable. When danger of winterkilling exists, these strong growing
kinds should not have a highly manured
soil and where they grow vigorous when soil, and where they grow vigorous when young, they may be root-pruned, as al-ready described. If they can be got through the first ten years of their life till they lose their youthful vigor, they will not suffer in severe winters afterwards .- Gardener's Monthly.

IMPORTANT SALE OF A VEAY CHOICE AND BECHE HOHE COILECTION OF ENGLISH AND FRENCH OIL AND WATER COLOR PAINTINGS, to take place on THUESDAY and FRIDAY EVENINGS, November I and 2 at half past 7 o'clock at the Art Gallery of the Auctioneers, No. 1110 CHESTNUTS, who are gratified in offering to the Philaselphia public this truly magnificent catalogue, in which are nearly lot specimess that were selected in London and Paris by a gentleman of cultivated tiste, ably, assisted by one of our most gifted artists, none of which works have yet been exhibited in America. Many of the first masters are here represented by guaranteed original specimens, which have unquestionable pretentions to a high cast of artistic character, eminemly superior in their peculiar line as works of art to anything offered to the public of this city, reflecting in the most positive manner the powerful and comprehensive grasp of intellect that stamp the English and French pencils with such lifelike portraiture. Among the most promitent names, whose productions would be an acquisition to the choicest collections of the country are the following—

J. F. Herring, Lebas,

sition to the choicest collectic following.

J. F. Herring,

Wm. Shayer, Senior,

J. D. Harding,
