

(From La Presse.)
A few days since a French journal of Con-

the extinguishing of eight different times the flames were kindled, and the pilgrim had brought, according to his means, of oil, eight and even twelve candles, at the expense of his money. The candles were blown out a blaze; five minutes after these candles were extinguished, the flames were kindled again.

But what enthusiasm! The men held their hands and handkerchiefs in the flames; the women held their hands and aprons. The flames towards their heads and necks, making the sign of the cross with the flames as they moved, and the crowd of pilgrims, these slightly consumed candles are prepared with a religious car; messengers are sent to the houses of the poor, to the Bethlehem, Holy Cross, and Sainte Barbe, near the Dead Sea.

The good Bishop Leake sends State Chaplains, holding in his hands two lighted candles, and he is besegged by pilgrims trying to kiss his hands. The good Bishop Leake, the Turks guard the tomb, and those who wish to enter must pay during the first three hours of the day, and the pilgrims who enter after this, from ten to twenty (about fifteen cents) francs.)

The pilgrims were extinguished the

are, however, a few well ascertained rules which may safely be followed. In the first instance, is that transverse shape generally tends to lessen height and increase breadth, while longitudinal shapes have the opposite effect. Another well known rule (which I believe is easily explained by reference to optical science) is that convex shapes tend to increase the apparent size, and *vice versa*. People of more than average height should be cautious about wearing white or very light colors for this reason, although it is always to be remembered that proportion and color impress the eye so much more sensibly than mere scale that this may be overruled in some cases. In the case of the neck, and only to be applied after those more important subjects have been considered. It should, however, be remembered that more than average size naturally involves a certain degree of ornamentation, which makes any peculiarity of dress doubly unbecoming in such cases. A small person may wear a large collar and a large shawl which would be inexpressively striking on a large frame.

unusual size as complete response both in form and color. Match trimmings, loose ends and streamers, frills and bows, and the prices of all kinds are apt to become intolerable when magnified. The result is that they may please, by a certain flustering impression which is kept up by the impression of a tiny creature. But here also the impression may almost reverse the effect of scale. A short heavy figure may even be made to give the impression of being more than twice its actual weight, which more than tends to slenderness. And this naturally leads one to the second request in which dress should be adapted to the wearer's own character; which, indeed, is scarcely separable from the first, and of which we have already spoken.

**The Eclipse.—Observations by an Eng-
lish Astronomer.**

Mr. Airy, the astronomer at the Royal
Academy in Greenwich, publishes the follow-
ing account of the observations of the total
eclipse, made by Major Tannant at Guntur,
India.

"I have to report a continuous spectrum
from the corona, and one of bright lines from
the protuberance. It is probable that the at-
mosphere of the sun is mainly of non-jumi-
ons or faintly-luminous gases, and that the
distance from the limb of the sun. It may have
been faintly luminous, and the light from the
jaws a good deal to get what I could see
at first, and consequently the lines would be
diffused somewhat, but I think I have seen
them. The protuberance I examined
was a very thick, narrow, and
almost to my eye, like a bit of the
sun through a slit, and of a brilliant and col-
or (I could see no tinge of color), and some-
times zigzagged like a flash of lightning. It
must have been very bright, and I think it
was on the preceding side of the sun near the
horizon, and was a subject for the first
phototype just before the sun reappeared
and the eye. Captain Brannil saw the
protuberance clearly at two o'clock, and the
gentlemen, but one in my observatory (like my-
self) only saw it within a few minutes.
But for a long time I never saw a Corona
markedly red, nor did I see a Corona
catch red soon, though I cannot conceive this

At conclusion I may note that the darkness was very slight, and the color not half so gloomy as it is in the tropics, where the light was partial at Delhi, where I was taken."

As the Bottom of the Pacific Ocean

It will be remembered that the recent earthquake in South America began on the 15th of August, and that day the great waves broke on the shores of Peru. On the 16th of August the waves reached Lower California on one side of the Pacific Ocean and Japan on the other. On the 14th, 15th and 16th of August the waves were observed at San Francisco, and at San Francisco, at this same disturbance of the ocean was observed at the same time, the waves rising and falling, for those three days, three or four feet every ten minutes. Taking all these facts together, and taking into the point of greatest intensity in the connection of the earth's surface, and the fact that in the Pacific Ocean, midway between S. America and Japan, there is a great island, where waves reached those islands sooner than they did California, and lasted longer, and was observed at the latter place, it is evident that it was at Japan. That the convulsion was as near the Sandwich Islands as the South America, if not nearer, is confirmed by the sinking of the shore of Hawaii; and the con-
