feet. At this ratio we will have, at two miles, the boiling, and at twon-ty three miles a temperature of a-bout two thousand two hundred de grees. At this heat cast iron, trap und rocks, and nearly all solid bod-ies, are in a fluid state. Hence we can easily account for the pumerous builing springs that appear in vari-ous parts of the world.' Physical best consists of two parts—distinct. but nearly related. The first relates to the natural influences of two bod-ies in altering their condition in re-spat to temperature. The second for the thermometer, is absorbed to modify the physical con-stitution of the body. This is what is meant by latent heat; that is a portion of heat has become latent in the body. This is called the funda-is regarded as one of the most brit-liant discoveries in physical science. Solidity and fluidity were long re-but, proporty speaking, they are only relative qualities i ar i. we are even to the natural influences of two bod-ies in altering their condition in re-spat to temperature. The second
