The Bairy ... No. 2. SELECTION OF COWS.—We are not going the pure bred cows of each breed we bred into a discussion of the different breeds of the same blooded bull, and crossed them upcow, as understood by cattle breeders, but on the grade and native cows, as we judged of the general characteristics of those best to effect our object of producing good suited to dairy purposes. We care not what milkers. Our thorough bred calves of each her breed, whether it be Short Horn, Ayrshire, breed, we of course raised, and selected the Devon, Hereford, Alderney, or Native, furmost promising of the grade heifer calves to ther than that she be a good milker. As to raise for future dairy cows. In the course the quality of her milk, it should always be of our operations we hred and reared about the quality of her milk, it should always be rich; as to the quantity, that may depend up on the size of the cow, and the amount of on the size of the cow, and the amount of that yielded thirty quarts of milk in the height of the season, which were not so economical to the dairyman as others not giving over twenty quarts. One ate enormously, the other moderately. It depends much, all the other moderately. It depends much, all the most of our herd, chiefly the pasturage as to what the support of our herd, chiefly the season, which were not so economical to the dairyman as others not giving over twenty quarts. One ate enormously, the other moderately. It depends much, all the other moderately. It depends much, all the most of our herd, chiefly the season attention to the dairy man as of the pasturage as to what the ground over twenty quarts. rich; as to the quantity, that may depend up sixty heifers, and with one exception only on the size of the cow, and the amount of which the food she consumes. We have known cowe dividual turned out a superior milker, with that yielded thirty quarts of milk in the height of the season, which were not so ecowell. But we will give the sequel. After the other moderately. It depends much, at the given the other moderately. It depends much, at the given the discontinued the occupation. MINGS, of any kind, and pay for them, he is prepared, on the quality of the pasturage as to what required, we discontinued the occupation. MINGS, of any kind, and pay for them, he is prepared to the pasturage as the payon of them are not of them at mublic sale. Comadopt. A compact, even-bodied cow will grades—a part of them at public sale. Comfrequently live and thrive, and do her best in ing in, as they did, at different sensons of the milk, where a large rangy beast would hare year to give a regular supply of milk as far ly live, and yield less milk than the other; as possible, our cows were in different conwhile, in abundant pastures, where the food ditions as to flesh. The full milkers were in is easily obtained, the largest animal, giving moderate flesh; the dry, and nearly dry ones a proportionate quantity, would be preferal were in excellent condition. As they were ble. So, in the selection of his cows the dai- put up to be sold, since every buyer wanted ryman should understand the quality of his "a first-rate milker," the question as to her astures, equally with the description of cows inilking quality was asked of each one when offered. There was a difference, of course, with which he is to stock them.

DESCRIPTION OF A DARKY Cow.—As a rule, some better, some not equally good. Yet, e would say, that a compact, small-boned no matter what the answer might be, the fatwe would say, that a compact, small boned test cows, in every instance, brought the most money! So much for the eye, over utility! cow of her kind, whatever the breed may be, is the most economical for the dairy. A rawboned, big-jointed, loose-made beast is usually a huge feeder, and a poor keeper, and although sometimes an extraordinary milker, is not, on the whole, a profitable one to keep. Our own style of dairy cow should have a our own experience, and observation. It small head, with a lively eye, and a light may be objected, and with considerable truth, horn. Her neck should be thin, her should we admit, as in late examples, that the Short ders open, or well spread apart; her ribs Horns and Devons are not milkers. To round, and extend well back towards her this we reply, that they are, naturally, good hips; her back straight; her loins and hips broad; her rump level; her flanks deep; for flesh, and symmetry of shape, chiefly, and her belly espacious, without being paunchy; her twist full, and low; her udder clean, silky in the hair, with fair sized taper teats, standing well apart as they issue from the bag. When milked dry, the udder should small, and shrunken-not meaty-but when full, it should be plump, and hard; her not advocating breeds of cattle, we speak ontail fine; her legs and feet small; and with ly of selecting good dairy cows, and perpetuall these she should possess a quiet disposition. It may also be added, that she have a yellow skin beneath the hair, be the hair what color it may, and the hair be fine, silky, and if possible, waving, or slightly curling These qualities, of course, will make a handsome cow-an objection in the eye of no one, and certainly none to the disadvantage of the cow possessing good milking properties. A beast the contrary of this description, altho-possibly a good milker, is not desirable; and when the kind we have described is just as easy to be obtained, as its opposite, if one will but take a little pains, the standard of perfection, or as near to it as possible, may as well be adhered to as otherwise. We say a yellow skin, as distinguished from a white, or pale one. A yellow skin usually indicates a rich milker, while a pale skin indicates that of inferior quality. All observing dairymen will acknowledge this fact. Exceptions occur,

Now, in contra-distinction to our choice of a cow, let us see, for a moment, how the mass of dairy cows are generally obtained. At "the West," where the cattle breeders usually pay little attention to the milking qualities of their cows, and breed them promisenously without regard to that quality, and also in various other parts of the country among poor farmers who raise now and then a cow to sell, the cow drovers, or buyers go out to make their purchases for the dairy markets-the dairymen, as a rule, do-not rear their heifer calves, but depend upon purchasing their cows, either of the drovers, or upon inquiry into the matter, that there is go out and pick them up themselvs, as best ! Of course, the selection by the drivers or dairymen, is not of the best, for lishers will allow a percentage on whatever the owners of them prize their superior qual. sales they may influence; and as this perity as valuable to themselves, and the pur chasers, consequently, are enabled to buy such only as the owners are disposed to sell. They are therefore a promisenous lot—a few good, some indifferent, and many inferior, if not decidedly bad. These cows are taken by the dairymen, and after trial a year or two, the worst are culled out by them as not being worth keeping, and in turn are sold to another passing drover, who proceeds on his journey towards market, and sells to a further dairyman, till the poor rejected beasts are finally brought up in the butcher's shambles! - And such is the history of very many of the dairy herds in our country-a short sighted, miserable, unprofitable mode of keeping up a supply of milch cows.
In opposition to this, we would propose

different plan. Having selected the best berd of cows we could find, instead of getting a wretched inferior bull, with just vitality enough in him to beget a calf, as the means of enabling the cow to produce her yearly supply of milk, and then destroying the calf soon after birth, we would select a bull of some distinct milk-producing breat—and that breed should be of a kind fitted for our own soil, and climate. This bull should be descended from a good milking dam, and also from a sire whose ancestors were of a good milking tribe, if possible. A close examination into these facts would give the bull a pedigree, of course, which we would demand. In addition to his milk-begetting qualities, he should add those of good shape, lineness, and general quality peculiar to his breed.— We would preserve the heifer calves by this bull from the best cows, and rear them to keep the number of our cows good, as the calves grow up and the cows are worn out or displaced. According to the general physiological law of "like begetting like," our young cows would nearly all turn out the first class of milkers." We would educate the calves to the development of their best milking facul.
ties thus: They should be rell fed—not
pampered; allowed plenty of new milk for
the first month, then gradually led off into
skimmed milk, or whey, with a little cat,
corn, or oil meal, and be kept all the while
stream of a mighty river. Our boat at first in a sweet grass pasture. At four months they would be fit to wean. From that time forward, pasture in good grass until Winter. Through the Winter, soft, sweet bay, and perhaps a quart of oats, or half the quantity of Indian meal a day, until grass in the Spring. Then good grass passure another Summer, and hay through the Winter. At two years old, grass again for the Summer, and turned to the bull in July—even her own manhood is along a wider, deeper flood, and sire, if he has proved a good getter, for such close breeding is not hurtful for a second generation. The young cow then comes in, a enjoyment and industry passing us; we are finely developed beast, and being gentle and docile, as she would be if properly treated, she furnishes a fine milking cow, perhaps at a little extra cost, but one which, in the natural order of things is worth one and a half ural order of things, is worth one and a half. or two that can be obtained out of a common till the roar of the occun is in our gars, and drove for dairy use. Three or four good the waves beneath our feet, and the floods heifer calves thus raised every year by an intelligent dairyman, will well keep up his leave of carth and its inhabitants until of our telligent dairyman, will well keep up his herd of twenty cowa, and in that proportion

for a smaller or larger number.

As a proof of the advantage of thus breeding up a herd of dairy cows, the writer would relate his own experience: Many years ago we kept a milk dairy for supplying the town people near by with milk. Our herd was a mixed one of different breeds—Short Horns, Devons, and Natives, with intermediate cross-come in confact without mixing, like oil and ea, and grades. We selected two compact, water.

Devon, pure in blood, each of his kind. To HARDWARE AND STOVE EMPORIUM
