T. ory of Land Drainage.

A plant, though spreading its roots to a certain distance all around it in the soil, is stationary, and must have its food brought to it. That is the first great fact on which the need depends for a current of water through the land. Water, a powerful solvent, brings substances out of the air which the plant requires as food, and these substances increase its powers as a solvent of other matters in the soil which the plant also needs as food. Moreover, water brings from the air materials of use in the soil in manufacturing food for the use of plants. On all these grounds, then, it is of importance that water should go through the soil after going through the air.—It becomes laden with vegetable food by passing through the air, and it becomes still more laden with vegetable food by passing through the soil, it passes stationary roots and enters them, and feeds the plants to which they belong. And there are special reason why rain water should be induced to pass through the soil rather than lie stagmant on it. In the latter case it is not only useless to the plant, but it is directly mischievous. By evaporation it cools the surface, whereas by percolation through the sandif carries the warmer temperature of the surface into the subsoil; and of what value this is to the growth of crops may be gathered from the experience of the last autumn, which has been so productive of growth in our pastures to so unusually late a season—not so much from the increased temperature of the soil and subsoil at one and two feet deep, which has been 5° and 6° above the average of the last thirty years, as from the increased temperature of the soil and subsoil at one and two feet deep, which has been 5° and 6° above the average of the past thirteen years, during which observations have been made near London. And not only is it of importance that rain, by passing through the land, should carry the temperature of the sunface, warmed by the direct rays of the sun, downwards, rather than, by evaporating from the sniface, it should carry t tion of the water is desirable, because in the one case air is made to permeate the land, in the other it is excluded. The chemical changes which air produces on and in the soil are desirable, and result in the preparation of useful food for plants; while by its exclusion, substances of a poisonous nature, especially where iron and vegetable matter exist together in the soil, are formed.—Morton's (English) Farmer's Cal-

Use of Water in Agriculture.

Irrigation, as a means of preserving and even increasing the fertility of the soil, demands morattention than it has hithered received here.—Perhaps there is no country where this source of fertility is so much neglected as ours. There can be no question that water—even the purest water—is not only capable of benefitting crops by a supply of that element, and by its solvent action on other substances, but that it is also capable of imparing actual fertility to the soil. Ample experience has established this fact, although the full explanation of it may not be readily known. It is known, however, from chemical investigation, that water contains some of the most important constituents of plant food, as carbonic acid and ammonia. It is known, too, that the soil has the power of absorbing these substances, and shis explains, in part, why irrigated lands grow richer. An important reason, therefore, in favor of irrigation, is, that all the benefit derived from it is clear gain—nobody, nothing is the worse for it—the result is obtained through an agent which, would have otherwise remained idle and unproductive.

In hilly sections, where springs and streams abound, irrigation may be practiced with comparative cheapness. In sections where water is not at al! times available, reservoirs might be constructed in which water from rain and snow might be collected at certain seasons, and from which it might be conducted to crops, in some cases simply by gravitation. In other cases machinery might be required for its distribution.—Agriculture of Mussachusetts for 1863. Irrigation, as a means of preserving and even

Draught in Plowing.

We copy the following from the Massachusetts Plowman, and ask from those of our readers familiar with the question, if the position taken here is the correct one? Does the draught of the here is the correct one? Does the draught of the plow, to any extent, depend upon the speed in which it is drawn through the soil, taking into consideration at the same time the draught upon the team? Now, all farmers know that there is a great difference in the draught of plows themselves. Indeed between some this difference ranges from 25 to 33 per cent. Would it not be better policy, therefore, to employ the light draught plows to begin with, and regulate other matters afterwards? We think so.—But to the extract:

"Meny semposes that the draught of a plow is

to the extract:

"Many suppose that the draught of a plow is, to some extent, dependent on the speed of the team. It appears to some that the friction, or resistance of the plow is less when the cattle move rapidly; others, perhaps, think it is increased, but the fact is, the draught is wholly independent of the rate of movement through the soil. It is important, therefore, that we should employ animals that naturally walk quick.

"The actual labor of draught being not greater the oxen or horses that move naturally at er, the oxen or horses that move naturally at er; the oxen or horses that move naturally at a rapid pace, accomplish nearly double the work with the same effort, that others, whose pace is sluggish and lazy, will do; and so the artual ex-pense to the farmer is no greater, or in other words, saves half, or nearly half, the cost of plowing by the use of a quick moving team, that is, if this rapid pace is the natural movement, and not one induced by over urging."

Manuring Newly Set Trees.

Manuring Newly Set Trees.

We this spring saw a neighbor finishing off the planting of a row of handsome maples in front of his dwelling, and complimented him on his taste and public spirit, and expressed the hope that his trees would live and flourish.

"They ought to grow," said he, "for I have put a half wheel-barrow load of hog manure into each hole."

"Have you?" we responded, "then the trees will die, and you may as well pull them up now and throw them on the brush heap." But he could not be convinced of his error.

"Hog dung done well on the corn-field, and with the hops and tobacco; and why won't it with shade trees?"

with shade trees?"

And so he left his handsome maples, with

And so he left his handsome maples, with their roots enveloped in the powerful manure, and the result was as might have been expected. A few leaves put forth in May, but in June they turned yellow and dropped off one by one, and to-day the trees are dead. The lesson is a plain one; keep away manure from newly planted trees. Give the roots finely pulverized surface soil, as good as can be found, and the trees will doubtless thrive. If the soil needs bettering afterward, apply, manure to the surface in the afterward, apply manure to the surface in the fall, and work it in in the spring, its effects will soon be visible.—Md. Farmer.

Waste of Mannres.

Manures may be lost by direct washing or leaching. The most precious ingredients of manures are lost in this way—such as potash, phosphoric acid, and ammonia. Salts of lime and soda, especially sulphates and chlorides, are readily washed out; hence they are found in all well-watera. The loss by leaching is, therefore, small, except in the lightest and gravelly soils. By chemical change manure may be lost or become inactive. Bousingault found that in the soil of his garden which had been highly manured for about six centuries, and which contained a large proportion of nitrogen, about ninety-six per cent. of this ingredient was inactive. When fertilizers are placed beyond the reach of oxygen, by being buried deeply in heavy soil, the chemical changes necessary to render them operative are entirely suspended.

Abolition of Fences.

Abolition of Fences.

The abolition of fences is now being agitated among farmers, and there seem to be no insurmountable obstacles to such a reform in mady districts. It is estimated that the fences of the country constitute as much as half the value of the farms, and these have to be continually renewed. But having strictly executed laws against stock running at large, all fences, except as surround pastures and stock-yards, may be dispensed with. Besides the saving in money, the room occupied by the fences is also saved, and the chief harbor for weeds is done away with. Fields can also be plowed and cultivated to better advantage when no fences are in the way.

For the Independent Republican. Gold and Silver Cake.

One cup of butter, 2 do sugar, 1 do milk, 4 do flour, 2 teaspoonfuls cream of tartar, and 1 of saleratus. Mix well.

Take half of the above ingredients—put the yolks of 4 eggs in the gold cake, and the whites in the silver cake. Also use white sugar for the cilver cake and brown for the gold. Flavor differently, to suit the taste.
