50 we raised last year, the smallest hen weighed six pounds, and the largest cock ten

pounds, at one year old. They produce more eggs than any fowls we have ever kept .---The hens often commence laying in less

than three weeks after hatching a brood, and continued laying every day regularly, at the same time taking care of the chickens until they are able to care, for themselves. We made a present of a pair of Shanghai fowls to a gentleman well known to all agricultural and horticultural readers. After a few weeks, happening to be at his place, we inquired how the fowls prospered, and were told that the hen had not layed. Thinking

this strange, we asked to see what eggs they had, when we found between two and three dozen eggs laid by our pullet, which we

readily recognized. On pointing out her eggs to our friend, he remarked : " My wife has several times observed that the hen that layed the yellow eggs, lay more than all the others." He had some half dozen of them. "They are good mothers, but lay a large number of eggs before wanting to sit-generally from forty to sixty. The young chickens are very hardy-much more so than any

"The eggs of pulletts the first year are small. Indeed, these fowls do not arrive at full maturity in less than eighteen months. For this reason, we think it would be better to raise crosses to kill in the fall. We killed a dozen crosses last year, at about six months old, the smallest of which weighed six lbs. dressed. They were from common itens and Shanghai cock .- Genessee Farmer.
