tion. For the introduction and improvements of this "tubbing" as it is approprintely called, the English Collicries are greatly indebted to Mr. Buddle, the well known ticologist and Mining Enwater can be. Let us now view the arrangements by which fresh air is supplied to the furnace and the impure return air made to ascend the upcast shaft without coming into contact with the fire, used in all Collibries of day size. This mine not which in case of there being gas present would being very deep, taps great sheets of water which ignite and explode it. The furnace, we discover to be a large ordinarily shaped one, burning some
