REGISTER'S NOTICE. Ranges, Stoves and House-Furnishing Goods in General. At Prices Less than any other House in Western Pennsylvania.

"PRINCE." He came a stranger to our town, and for the first time we brought him, and never did he trade from whom or whence he brought him. He had a mournful, anxious look, an almost human sighing.

He dropped his head on the ground, and drove it down the walk in a lively waddling toward me. "I was just going to see me the day before yesterday when I saw you, Aaron came with him."

"I turned white. How I felt. 'You and John can manage the place,' he continued. 'One of the vessels sails next week—Uncle Aaron's; he offers to take me.'"

Too much cannot be said regarding the makings of manure at this season, for now is the time when no other work is pressing and the profitable employment is not ready for all. While a great amount of material may be advantageously placed in the compost heap, and there saved, the quality of the manure should also be considered.

Manure is always rich in carbon, and it is not only a valuable fertilizer, but it is also a source of phosphoric acid. Many substances that are fed contain only traces of those materials, while other matter may excel in either nitrogen or phosphoric acid alone, or both.

Manure from the matured animal, therefore is more valuable than that from one that has not completed its growth, and it is also evident that, as food is given for the purpose of satisfying the demands of the animal, the material voided is valuable according to the assimilating power of the digestive organs, as every particle of nutritious matter will be excreted if it is not needed for the body.
