PROPER SIZE OF BEEHIVES.

A Southern Aplarist Gives His Experience on This Subject of General Interest. Apiculture is like some other professions in the way of progress, which seem to proceed, as it were, by a sort of ebb and flow. At one time it is ten frame hives, then "new idea" hives of a single story of 20, 30 or 40 frames, these to relegate to the rear to give place to hives of eight frames, and now these latter will most likely pass with the ehb for the flood tide to bring forward the ten frame hive again. A Georgia correspondent of The American Bee Journal, who in 1870 discarded the old box hive in favor of the ten frame Langstroth hive, gives his experience in hives as

The ten frame Langstroth hive gave me good returns, but I wanted to do better, so when General Adair brought out his small pamphlet on his "New Idea Hive" I applied the "idea" to the Laugstroth frame. Adair's frame was close fitting all around, something like a section. I made a dozen of these hives holding from 20 to 40 frames. These hives I worked exclusively for extracted honey, but when the season was over and the results summed up I found I got no better returns from them than I did from my ten frame hives.

For several years past I have been experimenting with the eight frame hive, and these experiments have taught me that there is a limit to hive space, modified somewhat by locality, which must be observed in order to obtain the more favorable results. In my locality the honey flow proper commences about the 1st of April and lasts till the middle of June, after which there is a dearth of nectar till the 1st of September, when the fall flowers appear. The bees in the eight frame hives would put the surplus in the sections in the second story and not leave enough in the brood chamber to keep up the working force of the colony for the fall pasture. The result was a deficiency of stores and a necessity to feed to enable them to pull through the winter. When spring came, they were weak, and by the time they built up the best of the honey season was over, but they did not so consider it and would proceed to cast off an abundance of unseasonable swarms.

Summing up my experience on the hive question, I am satisfied that, for most locations, a hive of nine or ten frames is as small as can be profitably used for either comb or extracted honey. By the way, I use a two story bive. The second story is devoted to either comb or extracted honey, and for my manipulation of hives I want a frame with a closed end top bar so as to be self spacing. For this reason I have long since discarded the old straight seven-eighth

Peas Do Not Vegetate.

Most gardeners have been more or less anneyed by the failure of peas to vegetate. The less of seed is not the greatest vexation, though that is material, but we plant our early peas and wait ten days or two weeks for them to put in an appearance, only to find that they will never grow, we cannot get back the time, and so we have no early peas. A part of the trouble comes from the fact that much of the seed is infested by weevils, which have eaten out the germ and rained it. We are sorry to believe that old seed, so old that it will not vegetate, sometimes gets mixed with fresher seed and thus reduces the number time grow. A still further factor in this trouble is the neglect of the gardener to snitably prepare the ground. In the early spring when it is wet this is often neglected, and the peas are covered with lumps of clay or heavy soil which soon harden and effectually prevent the vines from reaching the surface. The ground must be well mellowed before peas are planted. Lastly, plant thickly. If all come up, they can be thinned if necessary, but this is rarely called for.

Legislature on Tuberculosis. After six days of hearing before the committee of the Massachusetts legislature on tuberculosis in cattle the matter is finally left in the hands of the committee. There seemed to be substantially a unanimous agreement by all parties, veterinarians as well as farmers, that owners should receive full compensation for cattle destroyed. An estimate was made that \$650,000 would be needed to carry out the work. This, with \$200,000 for the gypsy moth, makes quite an expensive job at housecleaning, says Maine Farmer.

The Weight of Hay.

Compact timothy hay requires about 500 cubic feet to weigh a ton (considerably more, perhaps 700, as it is brought from the field), but the quantity wil vary with the pressure caused by the height of the mow and will the age of the grass when cut, ripe and stiff grass yielding less under pressure and requiring more in bulk to weigh a ton. Stiff coarse hay will be found to weigh less than fine and flexible hay, which will pack solid. The quantity we have stated is a fair average for well settled hay, says Country Gentleman. Sell For the Potate,

The American Agriculturist, in con-

little more tallow. sidering the best soil for potatoes, tells that in Maine most of the contestants for the prizes for largest yields preferred a gravelly loam soil, the original growth having been of birch, beech, maple and hemlock, while others cho a fine clay soil or a strong rocky loam. In New York state the prize potate crops were grown on a sandy learn with more or less gravel and some stones. though clay loam on a clay subsoil or . strong gravelly loam gave splendid re-Oud Mention.

The New York state fair will be held this year during the week beginning

The New England Homestead says: There will be a decrease in the New England acreage this year not because growers have agreed to plant less, but because so many are forced to plant less | got the facts from Grant's brother-in-That decrease, be it large or small, will law, Major Dent, who was the staff have very little effect on prices, because officer sent with the order for Butler's the foreign supply of wrappers can be relief. They should be ex- winter wheat, but the carrot needs 38 amined daily and the bugs destroyed. degrees and the bean 40 degrees before In the early spring pick the old bugs they will make the initial effort to send from the vines and destroy them.

### MARKET GARDENING.

How Abandoned Farms Are Being Converted Into Profitable Market Gardens. The time does not appear to be far off when a very large part of the territory in New England supposed to be occur pied by so called "abandoned farms" will be converted into market gardens. The neighborhood of the town of Rehoboth, R. I., say ten miles from the city of Providence, Pawtucket or Fall River, is a case in point. According to American Gardening, only a few years ago this town was apparently on the verge of dissolution. Old fashioned farming. the raising of wheat, rye and corn had ceased to afford even a scanty living; the young men had gone to the neighboring factory towns, while the old folks were eking out a meager existence on the old homestend; the buildings were tumbling into decay, fences in many eases had been used to keep warmth in the bedies of the old people, and there was but little left, but more or less picturesque ruin of people, buildings and

the former industries of the town. Now all this is changed, the old place have been patched up, new houses have been built, and rows of greenhouses and celery pits have taken the place of the old fashioned barnyards. The problem of ntilizing the abandoned farms has been solved by converting them into market gardens. In many cases the lands have changed hands and have come into possession of foreigners who have shown the native owners of the land what can be done by gardening. the raising of small fruits, vegetables, etc. In the locality mentioned strawberries, asparagus, cabbage and celery are the chief crops, and they are evidently suited to the light but fertile lands. The evidences of prosperity on every sido

What has been done in Rhode Island | the house, can be done almost anywhere. As lands building lots, or the assessments and will be converted into market gardens and their productive value very largely increased. It is doubtful if it will stand the view, "and he would have been General New England Homestead writes: When | kept at its best, or plant food must be and in small quantities. After the sowing of the seed and the harrowing the roller should follow. We have named these operations in the order in which they should take place, writes a correspendent of Country Gentleman.

> Let Your Rens Sit. The best results are obtained from

hens that are allowed to sit than when they are prevented from incubating. When the hen goes to her nest to lit she does so for the purpose of using the fat of her body to impart heat to the eggs, and as she seldom leaves the nest to feed she becomes reduced in flesh by the time the eggs are hatched. She also secures rest and recuperates. As a rule, a sitting hen is nearly always fat, and to prevent her from sitting simply keeps her in a condition unfavorable to lay ing. There are times, however, when no chicks are desired. In such cases let the hen go to the nest, giving her a few porcelain eggs. Do not break her from sitting, as she will soon become broady again and will lay but few eggs before going on the nest the second time, but if kept on the nest for two or three weeks and then "broken up" she will come off in excellent condition for laying and will lay more eggs than she would have done if prevented from sitting, including the time lost in incubation, and she will not become broody until she is in a fat condition again .-

Poultry Keeper. A Good Grafting Wax. Here is Country Gentleman's recipe for grafting wax: Take 4 pounds rosin, 2 pounds tallow and 1 pound beeswax. Put all into a kettle and melt slowly. and when all are melted and wel mixed turn all into a pail of cool water. Then grease your hands well with tallow or oil, and when the wax is cool enough to handle work it and pull it as you would molasses candy, and the wax will be perfect. Use a pail of tepid water to carry the wax to the field for use, and the hands must be kept greased when using it. If it is to be used in

Treatment of Large Bowlders.

Many large bowlders may be sunk by linging beside and under them and let ting them d.wn. In good digging it is cheaper than blasting and hanling away. Granite and flint may be split by burn ing the bruse on it and throwing a patl of water on the rock while very hot. Dymanite is a last resort, but safer than powder, says The Farm Journal. A specialist should be obtainable for handling the stuff and rending stones.

Why General Butler Was Relieved. Colonel Woodworth told some good stories about General Butler. He said that Butler himself told him as late as 1884 that he never knew the real reason why he was deprived of his military command by General Grant. It was only a few years ago that Woodworth was actually displaced because he was not a graduate of West Point. This would not appear on the face of it to be tried on his grounds last season to be of | a sufficient cause, but Grant explained it to Dent one day in the course of a confidential interview.

"If," said he, "I were to send Butnot. He was too able and original not to reason himself into the belief that I might have given different instructions if I knew all that he knew of the local situation. He therefore almost always had a plan of his own that he thought was better than mine or anybody else's. for when squashbugs once get well started in a field it is almost impossible would do or where he would be at a origin, but have been bred for many will be cured by the use of Mayers' Catarrh given time. Of course that was fatal to not bite the tissue, but sucks the sup first lesson in war is the necessity of at the New York station substantiate prompt obedience to the commanding general. Butler was too brilliant to be reliable."-Boston Advertiser.

## AIDED WILKES BOOTH

THOMAS JONES, THE MAN WHO SHIELDED LINCOLN'S MURDERER.

Kent Him In Hiding Six Days and Helped Him to Reach Virginia-The Reward of \$300,000 Offered by the Government Had Not the Power to Move Him.

There died in Charles county, Md., not long ago Thomas A. Jones, at the age of 74. Jones held a position in the Washington navy yard, but was dismissed through the influence of Congressman Mudd of Maryland, who had informed the secretary of the navy that Jones had played a prominent part in the escape of John Wilkes Booth, the assassin of President Lincoln.

"It's quite true," admitted Jones at Booth, with a broken ankle, sick and lots. suffering the tortures of the damned, was placed in my hands to be spirited ncress the river, and the \$300,000 reward, or even \$3,000,000, would not have caused me to turn traiter to the southern Confederacy, the people I loved, and surrender a man whose life was in my keeping, even if I did know he had assassinated President Lincoln."

Jones afterward told how Booth came into his hands. "It was on the morning of the 16th of April," he said, "when friends of Samuel Cox came to my house on Huckleberry farm, Maryland, and teld me that Cox wanted to see me at once. I had heard the evening before that Lincoln had been killed. I had a horse saddled and rode over to Cox's, who told me that Booth and David Herold had been there and wanted assistance to get across the river. I was show that there is ample profit in the told where the men were-in a pine thicket about a mile and a half from

heard the efficers give orders for the cavalry to go down in St. Mary's county; that the assassins were there. That was my chance, and I made good time to where Booth and Herold were concealed. Booth was glad to know that his time to get into Virginia had come. "The night was dark, and Herold and

I lifted Booth on to my horse. Our progress was slow. We finally reached my house, and I went in to get them something to eat. We then proceeded to the river. Booth was lifted into the boat and was placed in the stern, while Herold took the oars. I then lighted a candle and showed Booth by his compass how to steer to get into Machodoc creek and gave him directions to Mrs. Quesenberry's, who, I thought, would take care of him. That was the last I saw of

to furnish bread or water to Booth meant death," went on Jones, "I felt pretty shaky. I knew that Booth had hit the Virginia shore. I was arrested and taken to Washington, where I was held for seven weeks. Then I was discharged because nobody believed I knew anything."-New York World.

Seat of the Thunder God.

"Trembling mountain," a massive pile of peculiarly arranged rocks lying on Rogue river, almost directly north of Montreal, was known to the Indians by a combination of words signifying 'seat of the thunder god. "According to their traditions, the thunder god formerly used a broad and deep judentation m its summit as a seat, and that therein he would sit for three days in spring, seven in summer, five in autumn and two in winter. They also believed that during the time he was present great thasms would open in the side of the mountain, from which fire would stream for hours without ceasing. Nothing is known concerning the early history of the mountain, but it is thought that quite cool weather, it may centain a the legend refers to old time volcanic action, an opinion strengthened by its geographical name of "Trembling nountain."-St. Louis Republic.

"Why don't you quit the stage and start a secondhand book store?" "I don't see why there is any especial call for me to start a secondhand book store any more than any other business," replied the actor baughtily. "Oh, I thought it would suit you pretty well. It is the very place for back numbers. "-Cincipnati Tribune.

A Discussion on Crimson Clover. Crimson clover was one of many subects discussed at the annual meeting of western New York horticulturists. Professor Bailey told that it had been tested three years in New York and had not been killed on well drained soil. Professor Waite considered it a southern crop and not adapted to latitudes as far ered the latitude of Washington more adding one word to it-alone. trying than that in western New York. as in the latter region snow protected vegetation nearly all winter. Florida | the penalties of greatness?" suffered more from frosts than did western New York. Mr. Woodward said holder, with a sigh, "one of them is the crimson clover was a rapid grower having the income-tax collector know, and could be sown in September and plowed under in the spring.
