Work for Early Spring

The farmer who gets his seed in the

ground early has an advantage in several ways, as he must first plow his ground as soon as the teams can go on the land. A week's difference in the plowing has much to do with getting the soil fine, for should a heavy frost come on the plowed land it will greats assist in pulverhing the lumps, as well as desirny many meets which are thrown to the surface in such cases. The early plowing also gives the farmer more time to thoroughly harrow the ground until it is in a very fine condition, and that is one of the most important unitiers connected with the breaking up of the soil in the spring. One of the lessons that farmers have received and which is confirmed by their own experience is that the land will yield a much larger crop when But the crows, what of them? Luck- plowed early and worked over until than would be the case with hardpan What I heard was one crow's voice subsoil, but the working of the soil "that's so," that was ludicrously like ble of absorbing a greater amount PLANTING EARLY.

There are advantages also to be gain-

ed by planting early. When the seeds are in the ground some of them will fail to germinate and may be replaced by others, the full season for growth being obtained, but should the seeds go in late and many of them fail the whole season may be lost, because to replant may incur the risk of frost in the fall. Much loss occurs to farmers from late planting, and should the rains in spring not be up to the average in frequency, with a dry period early in summer, the farmer will have to lose more time by waiting for rain before he can prepare his ground or replant that which is not filled out in the rows. The best results from fertilizers are also obtained when the crops go in early, as it takes a large mount of water to dissolve them, and if a scarcity occurs at any time the effects of drought will be more marked naterial, for the reason that the plants will have made more growth and their demands are correspondingly greater. The loss of fertilizer unused by reason of insufficiency of moisture will also be an expense or charge against the erop which will reduce the profits. Crops never "burn up" because of too "The youngest member of the Fifty- much manure or fertilizer, but from EARLY WEEDS.

The early weeds do the most harm to crops that are planted late, as the weeds always secure a good start and entail considerable work after the land is prepared. Even if the land is plowed early and the regular crops do not go in until later there will be an opportunity to destroy millions of weeds that appear as soon as frost leaves and the ground becomes warm. The harrow, weeder and cultivator can easily clean out the weeds when they are out if the soil is not made fine and tools being necessary, while an occasional harrowing of the land intended for summer vegetables will keep the weeds in check and greatly reduce their number. The heavy snows will serve to protect wheat, but when they disappear and the corn land is plowed as soon as it can be done the farmer who loses no time in getting at such work will save much in time, labor and an-
