

TO AGRICULTURISTS.

IMPORTANCE OF SALT IN AGRICULTURE.—If we should ask why so enormous a quantity of this inestimable gift of salt is distributed throughout the earth...

THE ONLY PREPARATION STOOD THE TEST OF YEARS. AND GROWS MORE AND MORE POPULAR EVERY DAY! And testimonial, new and almost without number, might be given from ladies and gentlemen in all grades of society...

Common salt serves as a preventive of the fermentation and heating of hay, which has been heaped up in large stacks during the wet weather.

Leaves of trees, when put in ditches with salt, may be prevented for a long time from putrefactive fermentation, and will even make good forage.

Fodder of inferior quality, for instance straw, or other kind, soaked and bleached by rain and sun, cured too late, or become woody, may be rendered more palatable and easy of digestion by being salted.

Though the bad qualities of dusty, muddy, or mouldy fodder, after having been washed and threshed, are not entirely removed, yet, by giving a sprinkling of salt water, they will be diminished to a considerable degree.

By means of salt, such water as otherwise could not be used for drinking, will be rendered proper.

The great advantages to be derived from common salt with regard to the health of cattle, and the healthy nature of their products, are made by that learned and celebrated agriculturist of France, M. Boussingault.

THE SUPERVISOR AND MANAGER OF DAIRY BROWN. We copy the following from the report of the Committee of the Massachusetts Board of Agriculture on Cattle Husbandry.

The general aspect of the dairy animal is thinner, sharper, and more angular than a feeding animal. When selecting dairy cows we should look for a wide chest, small head, wide between the horns and eyes, small muzzle, thin skin, neck, sweeping smoothly into the shoulders, the shoulders at the withers thin, back straight, hips wide, and wide in the pelvis, and deep in the flank, ribs a little flat, belly somewhat large, udder large, extending well up behind and forward, her general appearance delicate and feminine; but, after all signs, the best recommendation a dairy cow can present is a list of long and successful lactations.

Given under my hand at HARRISBURG, Pa., the 15th day of October, 1860, in the presence of the undersigned, who are duly sworn, and their oaths are subscribed to the foregoing report, and the same is hereby certified to be true and correct.

Respiration is a species of combustion. At every breath we inhale oxygen, and consume the carbon or fatty matter of the food. When cows are worried or driven too rapidly, they breathe more frequently, inhale more oxygen, and more of the butyric portion of their food is consumed, leaving less to be converted into

butyric milk. Warmth is a substitute, to a certain extent, for food. Cows, when warm and comfortable, will consume proportionally less food, and it is well known to all experienced dairymen, that their cows yield more milk in warm, pleasant days, or when they have the run of a warm, well sheltered pasture, than on cold rainy days, or when they are in cold black pastures.

The Toilet.

THE ONLY PREPARATION STOOD THE TEST OF YEARS.

And testimonial, new and almost without number, might be given from ladies and gentlemen in all grades of society, whose united testimony none could resist, that Prof. Wood's Hair Restorative will restore the bald and gray hair to its original color, and give it all its youthful beauty.
