MELON BUGS -A capital method of protecting melons from bugs is the following : Let the farmer secure refuse tobacco stems from oigar manufactories in quantity according to the number of vines he has to protect. Soak them in water, adding a quantity of soft soap, say ten pounds to a barrel of the liquid Apply the dilution to the vines thoroughly with a syringe every few days, and no harm will be done by the bugs. This preventive is well at tested by thorough going farmers and garden. ers who have tried it and can testify to its effi 6807.

Sow BUCKWHEAT -- It is estimated that there were 160,665.823 bushels of wheat on hand last harvest for the consumption of the country, and that the quantity that will he on . hand at the coming harvest will not feach higher than 83 49 3,434 bushels. The ques tion arises, whence will the deficiency be sup We have heretofore suggested that plied? the extra crop of potatoes which we are now almost certain of, as well as a good crop of We now urge all farmers to sow large breadths of buckwheat. This would contribute largely during about six months of the year to supply the want of wheat flour. Tak ing our resources from potatoes, corn and buckwheat into account, we do not perceive why our laboring population may not go through the next year as easily as the past, as far as breadstuffs are concerned.

PROTECTING TREES AGAINST WORMS .- The bandage system, which we were the first to suggest some filteen years ago, and often re ferred to since, is the only effectual protection we have yet seen against the operations of the worm in fruit trees. We repeat again that in not a single instance have we ever had a worm in our dwarf pear trees where this sys tem was properly followed. It is simply to bandage the bottom of the tree with any kind of muslin or . loth and its it, letting the band age be about six inches above ground and two inches below. It should be applied in Febru ary or as soon as the ground is in a fit condi-tion to go upon. These bandages should be removed at the end of October. As long as this is continued we defy the worm. The bug lays its eggs an inch or two above the ground early in the spring, that is as soon a-the warm days in March will admit of itcoming torth from its winter quarters : the eggs are soon hatched by the sun, being late "the sun side of the trunk and the young grub finds its way down to the soft bark be neath the soi' where it gradually works its way in. The bandage prevents both the lay-ing of the eggs and the descent of the gru Let doubters try it One man will bandage two hundred trees in a day. We have no doubt it will als protect the peach tree in the same way - Germantown Tel
