

AGRICULTURE.

THE CANADA THISTLE.—Many of our readers are probably not aware that a bill to prevent the spread of the Canada Thistle was passed by both branches of the Legislature last winter, and now is the law of the State. It provides that hereafter any individual or corporation allowing the Canada Thistle to ripen seed on their premises, shall be liable to a fine of ten dollars.

USRULY CATTLE.—An ox or cow that is accustomed to throwing fences, may be prevented doing so by taking a large wire and bending it in the shape of a bow; then bend the points in the shape of a fishhook; the two strings to the wire, place the hooks in the nostrils lightly, and tie one string to the point of each horn. This will prevent, the most unruly ox or cow from throwing fences.

PRELINO POTATOES.—All the starch in potatoes is found very near the surface; the heart contains but little nutriment.—Ignorance of this fact may form a plausible excuse for those who cut off thick pairings, but none to those who know better.—Circulate the injunction, "Pare thin the potato skin."

STOPPING LEAKS IN ROOFS.—A correspondent recommends the following: Take four pounds of rosin, one pint of linseed oil, and one ounce red lead, simmer together, and apply while hot. We have no doubt it is an excellent recipe, and the cement may be applied to other purposes.

CLOVER ROOTS. At a meeting of the N. Y. Agricultural Board, at Watertown, President Goddard had some clover root furnished him by a farmer in Onondaga county, one of which measured three feet eight inches and the roots entered the ground as tap roots.—The longest one was evidently broken off in taking it up, and probably was six or eight inches longer making it more than four feet; the others nearly so long. Such appendages as these to the clover plant, in friable soil, may well account for the great value of this plant as a fertilizer. But this is nothing to one found by Mr. Crowell on his farm in Seneca county, the root being seven feet ten inches below ground and passed in going that distance through three different strata of soil. Mr. Crowell said this was not the only one of the kind growing on the same ground, and rather intimated that with care much longer ones might be found. No wonder swine are so fond of clover; and if they had to depend on the bottom for a living, we might well change the vulgarism, to "Root, hog and die."

PEAS AND CORN. Don't forget to put in crops of Peas and Corn as a succession, if you desire to enjoy those fine vegetables throughout the season or nearly so. As to corn, there is no reason why we should not indulge in the luxury from the time the first boiling pot is obtained up to hard frost. If crops are planted every two weeks to the last of June or first week in July and properly cared for, this will be accomplished. Stovell's Evergreen, which we believe can be obtained at all the agricultural stores in the city and most of the stores in our towns and villages, we find to be the best in quality of all others, and most reliable for successive crops. If you want to preserve it pure and uncontaminated with other corn, it must not be planted in the same plot of ground or garden with other corn ripening about the same time. It is a good mode to change the seed about every other year. It will have the effect to produce larger stalks and ears and more of the latter—very few of the stalks having less than two ears.

Germantown Telegraph. ASHES AND PLASTER ON CORN. We have been in the practice, for some years past, of applying a mixture of ashes and plaster to each hill of corn immediately after planting it. Take eight bushels of ashes and two bushels of plaster, and mix them together. This will suffice for an acre.

Now place a handful of this mixture on each hill as soon as an acre has been planted and covered. The print of the hoe will show where the corn is covered. By dropping the ashes and plaster at this time you will save one half the labor compared with waiting till after the corn is up. You will keep the worms at a distance and start the corn earlier. And as weeds are not ready to start up through the ashes, you will find the labor of hoeing much less than where weeds are found in the hills. So says the.
