Vince Schaefer, with Dr. Irving Langmuir (left), makes snow in his laboratory cold-chamber.

What it takes to make a G-E scientist

Vincent J. Schaefer is the man who discovered how to seed supercooled clouds with dry ice and make them produce snow and rain . . . who has developed meteorological instruments like the "cloud meter" which automatically measures the water in a cloud . . . who, during the war helped develop smoke generators, gas-mask filters, submarine detectors.

He ranks as a true scientist. But if you have formed stereotyped ideas of what it takes to rise to the top in a scientific organization like that of General Electric—if you think that capable men become "lost" here—consider Vince Schaefer more closely.

He had to end his formal education go to work after two years in high school.

His first G-E job was on a drill press. When he first got into the G-E Research Laboratory, it was as a machinist.

But he had the scientist's intense curiosity, the desire to pierce beneath the easy surfaces of knowledge, the imagination to conceive new approaches to nature's mysteries. G-E scientists like Dr. Irving Langmuir recognized these qualities and gave him his chance.

Stories like this are possible where emphasis on research and incentives for creative thinking are the tradition. By "finding" men of high caliber, General Electric stays in the forefront of scientific and engineering development.
