Soon to receive his Ph.D., partially through an IBM education program, Harold Mechanic (B.S. in Mathematics, CCNY '53, M.A., Columbia '55) is constructing ingenious mathematical models of advanced IBM data processing systems.

a mathematician works in the mainstream at IBM

Advanced data processing systems—whether designed for business, industry, science, or government—have been made possible by the talents and abilities of the mathematician.
 Harold Mechanic, for instance, is working in areas of system simulation. He and his colleagues have done some of their most interesting work in building mathematical models to study the performance of proposed Tele-Processing* systems. After transforming the models into computer language, numerous possible system configurations were fed into a giant computer to determine an optimum arrangement of components. Thus, like many mathematicians at IBM, Harold Mechanic is able to use the computer as a tool to advance both theory and technique of systems analysis.

If you are receiving your degree in mathematics, you might do well to investigate the unusual opportunities at IBM. Working alone, or as a member of a small team, you will find many chances to make important contributions to your field. You will also be eligible for excellent education programs.
 Positions will be open in mathematics research, computer programming, and applied mathematics. The IBM representative will be interviewing on your campus. He will be glad to give you further information. Your placement office can make an appointment. Or you may write, outlining your background and interests, to:
 Manager of Technical Employment,
 IBM Corporation, Dept. 888,
 590 Madison Avenue, New York 22, N. Y.
