

Newman Expresses Thanks to Judicial

Monroe Newman, head of the Senate sub-committee on discipline, opened the first judicial conference last night by thanking student judicial members for their good work.

Newman, in his concluding statements at the opening banquet, thanked the judicial members "on behalf of the students you have helped and who have lacked the insight to see the good which the judicials have done for them."

The conference of all student court members which will continue today has been set up to take a look into the judicial system, James Ettleson, chairman of Supreme Court, said in introductory remarks last night.

Newman said that the guiding principle he uses in disciplining a student is "Do what will best help that student while at the same time hurting no others." But, he emphasized, the rules must be enforced without exception.

In the intellectual environment of the University everyone, professor and student alike, must abide by the minimum behavior standards as outlined by the institution, he said. Those who do not go by the rules must be censured and their privileges taken away. They have not lived up to their

responsibilities, he continued.

The "penalties" outlined by the offices of the dean of men and the dean of women are based upon this principle, Newman stated. Most of the penalties are designed to limit participation in University-sponsored affairs, he illustrated.

The conference will continue today in four workshops which have been set up so that judicial members can have their questions answered through discussion, according to Ettleson.

The workshops will discuss policies on discipline, plans for the future, responsibilities and jurisdiction, and penalties and enforcement, he said.

In the afternoon all of the judicial members present will meet in the Hetzel Union assembly room to coordinate what they discussed in the individual workshops. At this time recommendations for changes in the judicial system will be made, Ettleson said.

Chaiken Reports IFC Workshop 'Very Successful'

The Interfraternity Council workshops held Tuesday and Wednesday nights were "very successful," according to Eugene Chaiken, IFC Workshop chairman.

There was a record turnout, Chaiken said, "the best attendance since the workshops began." Approximately 48 persons attended each of the 11 workshops, he said.

The banquet, held Wednesday night at the Nittany Lion Inn, was also well-attended, according to Chaiken. Presidents of the fraternities, workshop committee chairmen, fraternity advisors, IFC officers and representatives from the dean of men and dean of women's office were present. Dr. Henry A. Finch, professor of philosophy, was the speaker.

Phi Sigma Kappa received the Sigma Chi Scholarship Improvement award for being the fraternity showing the most improvement in scholarship since last spring. Alpha Zeta was awarded the Social Professional Scholarship Trophy and the Social Scholarship Trophy went to Delta Phi.

The workshops, held annually, were aimed at providing leadership training and discussing the adaptation of the fraternity system to the University's new four-term plan, Chaiken said.

Lattman Explains Purpose of Mohole

By DOTI DRASHER

Several miles off the coast of California is anchored a large craft on which a research team is busily drilling through the ocean bottom searching for rock and mineral material.

This is project Mohole; and the purpose is to obtain samples of the interior of the earth's crust, Laurence H. Lattman, assistant professor of geomorphology, said Thursday night.

At a lecture sponsored by AWS South Halls Council, Lattman said that the drilling rig is operating off the coast of California because the earth's crust is much thinner under the ocean — only three miles thick instead of 20 miles as it is over the land.

The Mohole gets its name from the Yugoslav scientist, Mohorovicic, who discovered the discontinuity between the earth's crust and the earth's mantle, he said. It has been shortened to the Moho discontinuity and this name was adopted for the project, Lattman added.

In drilling through the earth's crust over the ocean, the rig and barge, called Cuss 1, must move out of sight of the land. The main hope is that it will add to man's knowledge of the earth.

drifting and breaking the drilling pipe, he said. A device called the shoran was invented which could tell whenever the barge drifted more than 100 feet from the drilling site.

So far, all the project has produced is the invention of the shoran device and some "sunburned scientists," he said.

Just recently the Russians heard of the U.S. Mohole project and have started one of their own. Now the "race for inner-space" has begun also, Lattman added.

The Mohole project was begun in 1957 when the "panic button" was pushed in Congress to get our scientists busy, he said.

What the scientists will find when they reach the discontinuity and get the samples of the material is not known, he said, but the hope is that it will add to man's knowledge of the earth.
