

Rural Economy.

"He who by the plough would thrive,
Himself must either bold or drive."

The Apple Orchard.

The Michigan Farmer makes these possible remarks upon the present apathy or neglect respecting the apple orchard, which we reprint as being perfectly applicable to Pennsylvania and surrounding States:

"The old orchards planted by our forefathers, are going to decay, or have already departed. On some farms they are replaced by vigorous bearing trees. On others the only apple trees are a few scattered seedlings, bearing indifferent fruit. The owners buy their winter apples every year, or go without. Our soil and climate are so admirably adapted to this fruit, that we have no excuse for going abroad for our supplies, and yet thousands of barrels come to us every year from Central New York, and farther west. This is a disgrace to our husbandry, for we can raise this fruit fifty per cent. cheaper than anybody can raise it for us. In selecting a site for an orchard, avoid the spot that has been previously occupied by apple trees. The experiment has been tried, and all who have had experience in the matter, agree, that new ground is best for this purpose. A recently cleared wood lot, where oak, hickory, or chestnut have thriven, will bear good apples. But such ground is scarce in the commonwealth, and any good corn land, bearing sixty bushels to the acre, will answer. The apple tree delights in a deep, gravelly loam, with a yellow subsoil two or three feet deeper. If not in good heart, it should be made fertile by manuring and cultivation."

To Raise Potatoes.

A correspondent—William Aldridge, of Goredland, Ind.—writing to the Prairie Farmer, states that having noticed how potatoes were interrupted in their growth, and invariably pined away and died if disturbed and bruised when wet with dew or rain, he selected a patch of a potato field, the whole of which was good soil and in good order to try an experiment. This patch he only plowed once, and then loosened the soil with the hoe when the vines were above ground, and in the heat of the day when they were perfectly dry. He never touched them afterward until they were in October last year. These vines kept green throughout the season, and the yield of potatoes was very large. The other portion of this same potato field was purposely worked three times, when the vines were wet with dew. These blighted early, did not produce half a crop, and the potatoes were of a very inferior quality. The ground, seed, and time of planting in both patches were the same.

Planting Box.

Few people, except professional gardeners, know how this handsome border ornament ought to be planted. It is usually stuck in a few inches and left straggling on top of the ground, with three or four times as much top and three or four times less bottom than it ought to have. Box grows nearly as well from the branches as the roots. Now, the trench in which the edging is to be planted, should be full spade deep on the border side, being a few inches shallower on the alley side—the soil should be made fine—and the box inserted to the bottom of the trench, packed in tightly with soil, leaving only one and a half to two and a half inches out of ground. There will be no danger of it not growing, or of producing full foliage at the ground. Of course no one would think of planting box without a line.—*Our Telegraph.*

Moths in Carpets.

An experienced housekeeper writes: "Camphor will not stop the ravages of moths after they have commenced eating. Then they pay no regard to the presence of camphor cedar or tobacco—in fact I rather think they enjoy the latter, if anything else than humanity can. Nor will the dreaded and inconvenient taking up and beating always insure success, for I tried it faithfully, and while nailing it down found several of the worms 'alive and kicking,' that had remained under the pile unharmed. I took them who were wholly in this way. I covered a coarse wash towel and wrung it out of clean water and spread it smoothly on the carpet, then ironed it dry with a good hot iron, repeating the operation on all suspected places, and those least used. It does not injure the pile or color of the carpet in the least, as it is not necessary to press, heat and steam being the agents; and they do the work effectually on worms and eggs. Then the camphor will doubtless prevent future depredation of the miller."

A Charming Country.

A large portion of the swamps of Florida are said to be capable of producing 500 bushels of frogs to the acre, with alligators enough for fencing.

Some are but the prints of the
Others—the stamp of eternal life.
