MINGLING THE MILK OF DIFFERENT Cows.-At a meeting of dairymen one of the members gave some interesting details in regard to experiments in mingling the milk and cream of different breeds. He found that the mixed milk from two breeds will not produce as much butter as the same milk churned separately. The explanation is in the variation in the sizes of the globules. When a large globuled milk and a small when a large globuled milk and a small globuled milk are churned together the larger globules separate first into but-ter, and the breaking of the smaller globules appears to be retarded. When, therefore, a Jersey cow is kept in an Ayrshire or Dutch herd for the purpose of influencing the color of the butter, the large globules of the Jersey milk being over-churned, and-theoretically, of native or grade cows. Unless there is uniformity so seldom found in the ex-

HASTENING THE RIPENING OF FRUIT .pear tree, eight weeks before the nor spectively fed on leaves of trees treated mal period for ripening, for a space of by the ordinary and by the new system, thirteen to fifteen feet in diameter, and to such an extent as to leave a depth of being gathered exclusively at the hours earth over the roots of only about two corresponding to the ebb tide,—resulted to four inches which could be thorough most decidedly in favor of the latter. ly warmed by the sun. He was surprised not only by the ripening of the truit in the middle of July, but also by fruit in the middle of July, but also by months ago, Darwin wrote to his dis-its superior judiness and flavor. In ple Fritz Muller, now in Brazil, directanother experiment, the removal of the ing his attention to the habits of the earth from the north side of a tree leaf-cutting anis. The reply contains alone caused the fruit on that side to a confirmation of Mr. Belt's observaripen several days earlier than that on tions to the effect that these ants do not the south side. Frequent watering feed on the leaves they gather in such was of course, necessary in the above vast quantities, but on the fungus

MACHINE FOR ASSORTING POTATOES .-This machine consists of long rollers, a hopper, assorting board and grading ers, the small potatoes will escape be-tween the roller and assorting board, roller or rollers and the assorting board never missed the ants, and adds : increases from the head toward the tail, wonder that it had never occurred to space, varying in size in the same measure, so that they can be separated into two or more grades by suitable partitions in receptacles below. The assorting board is adjustable toward and from the roller can be thought the this is really the case, for young plants of cecropia, not yet inhabited by ants, are often attacked by herbivorous in sects." and the potatoes escape through the and from the roller, so as to change the grade at will.

CHANGE OF SEED.-The American Agriculturist answers a correspondent by saying: With all other grain than corn a change of seed is now and the: considered advisible. Potatoes are especially improved by a change pro-cured from a different locality and soil But corn has not generally been found to deteriorate by long planting; on the other hand there are many farmers who are now planting seed produced from the corn their fathers planted a generation ago. Running out of the corn is more likely to be the result of impov erished soil, and the best method of im provement would probably be a crop of clover upon the land, to be ploughed under, or some other substantial ferti

PURE WATER FOR ANIMALS .- Oge reason why epidemics among cattle, hogs, and horses are so common and fatal, is because they de not have pure water. As the country grows older and is more extensively settled, the stream-are more likely to be polluted with excrement from decaying organisms; and this taken into the blood of animals is sure to breed diseased conditions. Once such epidemics were common among men, and swept off a large par of the race. Now, by wise hygiens most of them are avoided. The cattle and borse plague will some day be got rid of by hygiene-never by any other

One way to disperse and destroy tent caterpillars is to swab their nest at evening or in early morning with a bunch of rags fastened to the end of a slender pole, and saturated with lye or soft soap made strong.

water, nor will they pay a profit so kept. of 1790 lived 33 years and 9 months the artistic instinct for adorning and after they were 90 years old. From these facts, says Dr. Jarvis, it is plain that life, in many forms and manifestations, and probably in all, can be exipanded in vigor, intensity and duration panded in vigor, intensity and duration under favorable circumstances. For this purpose it is only necessary that the circumstances amid which, and the conditions in which, any form of life is placed, should be brought in harmony with the law appointed for its being.

HOW A SURGICAL DISCOVERY WAS MADE ACCIDENTALLY. - The Estaliche Hansfreund is responsible for the following account of the cruel misdeeds of a brutal woman leading to the discovery of an important method of performing painless surgical operations: A wicked stepmother placed a net upon the head the large globules of the Jersey milk are broken first in the churn, and, while the smaller globules are being broken, the butter which came first is being over-churned, and—theoretically, March, 1872, the girl suff-ring with at least —the quality of the result is impaired, if not the quantity lessened. Professor Dr. Dittel. Dr. Dittel made When a few Ayrshire or Dutch cows are a careful examination of the head and kept in a herd of Jerseys and the milk churned together, both theoretically and practically, a large portion of the butter of the small globuled milk is left in the buttermilk in a state of globules. The poor girl died of inflammation of the cerebral members and practically and practically. A like application may be made to herds brane, and upon dissection it was found that not only the pericranium but also even the skull bones were cut through ternal shapes of a grade or native herd, as if with a sharp saw. This proved it is not probable that any greater uni- what power is exerted by elastic cords for nity exists between their functional productions, and since then Dr. Dittel has employed them for cutting off tissues and removing swellings and tumors.
