In 536, 567 and 626 we find mention of long periods of diminished sunlight. Schuur- crable progress has been made with the rer records that in 788, a year after the Saracens had been driven back beyond the Pyrenees, consequent on their defeat at Tours, "the sun darkened in an alarming manner on August 19. There appeared to be no eclipse by the moon, but rather an interruption from some meteoric substance." There was an eclipse of the sun, annular but nearly total, on the morning of August 19. There appeared to be no eclipse by the moon, but rather an interruption from some meteoric substance." That figuring the earth is the first on which meridians of longitude and paralleles of latitude were laid down. The but nearly total, on the morning of August 19. There was an eclipse of the sun, annular but nearly total, on the morning of August 19. There was an eclipse of the sun, annular like it is reported, are all to be found upon it. 14; it is mentioned in the Saxon Chronicle which tell us that "the sun's disk was like a black shield." The near coincidence of date suggests, in this case, a connection between the darkness and the eclipse. In 934, according to a Portuguese historian, the sun lost its ordinary light for several months; and this is followed by the doubt-I il statement that an opening in the sky eemed to take place, with many flashes of lightning, and the full blaze of sunshine was suddenly restored. In 1091, on Sept. -not 21, as given in some of the translations of Humboldt's "Cosmos"—Schnurrer relates that there was a darkening of the sun which lasted three hours, after which it had a peculiar color, which occasi sued great alarm. A century later, or in June, 1191, according to Schmurer, the equator; the toise used in Lapland some sun was again darkened, with attendant such as a such effects upon nature. Here the cause is poplar degree, and the plantinum kilo- life cause of the knuckling overthe aseasily found. On June 23 there was a to- gramme made by the Republican Comtal eclipse, in which the moon's shadow traversed the continent of Europe from Fresnel's len, the first ever graduated, Holland to the Crimea. The eclipse was is also deposited in the new museum, is produced on the loins and rear parts, total in the country between the coasts of and the object glass of the great astro-Cumberland and Yorkshire. Firman refers | nomer Casssini, which he used in sucto a sun-darkening on Feb. 12, 1106, which was accompanied by meteors; and we read in the cometographies that on the 4th-or, according to others, on the 5th-of February in this year, a star was seen from the third to the ninth hour of the day which was distant from the sun "only a foot and a Matthew Paris and Matthew of Westminster term this star a comet, and wamny take it to have been the same which later in the same month was observed which later in the same month was observed | which is especially adapted to solar en-in China under the sign of Pisces, and largements, is published by the Associwhich at one time was supposed to be iden- ation Belge de Photographic, the plan body, however, would not appear to have charge a small quantity of cotton with

After this, than usual with comets, to account for the plate is provided with a coating of diminution of the solar rays by its interven- collodion or varnish, and immersed in tion. On the last day of February, 1206, according to a Spanish writer, there was a complete darkness for six hours In 1241. "five months after the Mongor battle of Leignitz," the sun was so obscured and the darkness became so great that stars were seen at the ninth hour about Michaelmas, In this case, again, the darkness referred to was undoubtedly due to the total eclipse of October 6, of which Prof. Schiarparelli has collected a full account from Italian writers. Later, in 1847, from April 23 to 25, Kepler relates, on the authority of German "the sun appeared as though suffused with blood, and many stars were visible at noon-Schnurrer thought this phenome was what the Germans call a "hobenrauch," notwithstanding the visibility of From the above brief summary of what have been considered sun darkenings. The plate is subsequently immersed in but there are some men who are extite generally arises from the disorder-we see that in several cases the diminution warm water of thirty degrees, after of light has been due to theordinary effects | which the paper is detached, and the the cherished notions of the past and exercise and the occasional use

Sunlight and Health.

Sunlight is even more necessary to health in summer than in winter; for one, among other reasons, that disinfectants of all sorts are more necessary in summer than in winter. The rays of heat quicken the vital powers, the chemical rays exert their mysterious and potent influence, and the illuminating rays, independently of the others, communicate motion. The exhacations from our bodies in warm weather are more copious than they are in cold weather, and if we shut out the light from Crisp recently somewhere down in Georgia. The text of the funeral address, oddly enough, was: "Well done, thou good and faithful servant." The noxious vapors, which free admission of air and light would remove, are absorbed of air and light would remove, are absorbed by carpets and upholstery, and are productive of disease. Those who accustomed to It is no sign because a farmer is the darkness and dampness of close rooms growing sage that he is becoming the darkness and dampness of close rooms wise. Or, because a farmer makes good may not consciously suffer therefrom, but that they sustain real injury is evident in the padid faces, their flaccid muscles, and nerveless movements. The contrast between them and those whose lives are passed in the open air is too evident to need mment. It may not be necessary to expose during the day every room in the house to the direct rays of the sun, but there should be frequent opening of the doors and windows, so that the solar rays may perform their beneficent office. Bedrooms and other rooms in constant use should receive most careful attention in this respect; sick rooms especially require thorough sunning and ventilation, and, if possible, should always have a southern aspect. More patients die on the north side of hospitals than on the south side; there are more deaths on the shady side of any street than on the sunny side. A notable Southern housekeeper, observing strictly the following rule during the summer months, kept her house perfectly dry from May to October: Until 10 o'clock in the morning all the doors and windows back is a deep blue, spotted with gold, and its belly is striped with red. When the bug walks on its forelegs it reminds as they liked. He found that they decrease of a circum contact and its belly is striped with red. When the bug walks on its forelegs it reminds as they liked. He found that they decrease of a circum contact and its belly is striped with red. What a screamer! is a tritute often paid to a crystalling back, but by sales into the account of the paid to a crystalling back is a deep blue, spotted with gold, how be replied that she were opened wide; then they were closed to be in the habit of turning his back is a tritute often paid to a crystalling back, but by sales into the orchard in the fall where they could eat as many apples as they like a tritute often paid to a crystalling back is a tritute of the walled in the document of the walled in the document of the wall the wall that the paid to a crystalling back is again until nightfall. This rule might not should secure a free access of light and air to every part of the house at least once a day would be productive of good results.

> Figures Don't Lie. SPARTA, Union Co., Oregon, May 30th, 1879. Butter Improvement Co., Buffalo,

N. Y.: Sirs-The package of "Butter Maker" forwarded by you to W. W. Ross, Esq., of this place, was handed over by him to me for trial, and orders to report the results to you, as I have the management of this dairy.

I have the honor to report that one

gallon of sweet cream churned at a tem-perature of 55 deg. and treated with the Butter Maker according to directions accompanying package, produced four and one-half pounds of butter of a fine golden color, and firm, waxy texture, and of delicate flavor; time occupied in churning and gathering the butter, twenty minutes. One gailon of sweet cream, same lot, churned withou; the powder, produced four pounds of butter several shades

lighter in color, not so firm or waxy in texture, but no perceptible difference in flavor; time occupied in churning, at same temperature as above, fortyfive minutes. The fine, even grain, rich, golden color, increased quantity from the churning and gathering the butter, are greatly in favor of using your preparation, and I have no hesitation in recommending the same to my friends and the public generally. Your obedient servant,

GEO. W. EASTERBROOK.
