The conclusion is that under ordinary conductions in the trade, with an aggregate band had almost faded out of sight. in every way satisfactory.

We do not understand fully the rationale of the curing of meat by the preservative action of smoke. Wagner gives the following explanations, which are as satisfactory as our knowledge of the subject will permit. In the first place, he states, the heat of the smoke dries the meat, while forther, smoke contains a crossote. Trist crosses for the year from fires and other crosses possesses the property of coagniating the albuminous substances of meat, and, once coagulated, and thereby renderand, once congulated, and thereby rendered insoluble, these substances are not capable of decay, or only so after a great lapse of time. Smoke, moreover, contains some pyroligeneous acid, and other creosote-like substances (oxyphenic and carbobe acids), which undoubtedly play an important part in this preservative action.

Ether spray, in the practice of Dr. McColganan, has not only immediately quired for solution, until the mass becomes tenacious, but yet remains transparent. After cooling, 50 gras, of tea previously mixed with 50 gras, of dry sugar are ad affected nerves so as to have produced a complete change in the nutrition and its moulds, and when solidified forms the preserved tea.
