The boy who goes fishing, with a pall of worms for balt, little knows what a pleasant hour he might have, and yet make his outing much more agreeable for the worms and for the fish. He should take a look-a scientific peepat the contents of that pall, instead throwing them ignorantly away. After all his pains in digging for the worms, he and they are scarcely acquaintances; and yet, if we should ask him, he must admit that he has dug up worms in the springtime, year after year and sone fishing, knowing as little about the worm when his sport was over as he did when he started out.

To see really what sort of a fellow the common earthworm is, first put him into a bowl of water. He will soon wriggle himself free of every particle of dirt, and you may then make him more comfortable on some dry, smooth surface while you study the peculiar movements of his remarkable body, which consists of a series of segments, or rings, all alike in form, except at the two ends; the anterior end tapering to a blunt point; the hinder nd being broad and flattened.

Watch the worm shorten himself after a long stretch. Projecting from ring, you will see the tiny bristles, called setae, with which he manages to walk. When he lengthens his body. the setoe on the hinder rings prevent him from stretching backwards, because they, in pointing backwards, stick into the ground. The worm can therefore, stretch only forwards. In the same manner, when he shortens his body, the setae in the front rings stick into the ground, and the hinder part of

complicated and wonderful, but it is no more wonderful than that you should be able to balance your body on Pungi and lichens, which you see thought to how you do it, or to how wonderful it is that it can be done without thought. Watch a baby's of forts to keep his balance in learning to toddie only a few steps, and you will understand that walking seems east to you, because you have had so much

The usefulness of the worms may be seen at once when you compare some of the things that they do with those that they are unjustly accused of doing. They do not destroy the roots of grind with the muscles of the mouth: but they have no teeth with which to guaw. They are useful to man in boring through the ground and loosening the soil to make it ready for the fibers of plants to enter. Surface soil is more or less loose, but the sub-soil is hard would soon die if no opening were to enter.
