SUPPOSED PREVENTIVE FOR CARPET BEETLES.—A writer in the Germantown Telegraph suggests that, as the larvae of the bacon beetle (Dermestes lardarius), an insect closely allied to the carpet beetle, will shun their food when tallow is placed near them, their repugnance to that substance being so great that the insects will devour each other rather than approach it, the same peculiarty may be quite possibly met with in the larvae of the carpet beetle; and if so the coating of floors and filling the cracks with tallow (the cracks be-ing their place of concealment) would possibly prove an effective destroyer of these troublesome pests. The experithese troublesome pests. The experiment could be easily tried. If good mutton tallow be employed there could be no hurtful absorption of the grease, especially when the carpets have linen backs.
